FOR SALES AND IMPLEMENTATION PARTNERS

Pockets POS Partner Guide

What Pockets POS does, who it is for, and how to demonstrate and set it up.

Pockets POS is a ZIMRA-ready point of sale for Zimbabwean retailers: a web back office, a browser selling screen and a Windows till that keeps selling when the internet is down. This guide is for partners who sell, demonstrate and set up the system.

01 The pitch in one minute

ZIMRA fiscalisation built in

Every sale is a signed fiscal invoice and every refund a credit note, with QR code and verification code on the receipt. Fiscal days open by themselves; managers close them with one button.

Never stops selling

The Windows till sells with no internet and catches up automatically. When ZIMRA is unreachable, receipts are signed on the spot and sent later.

One system, every branch

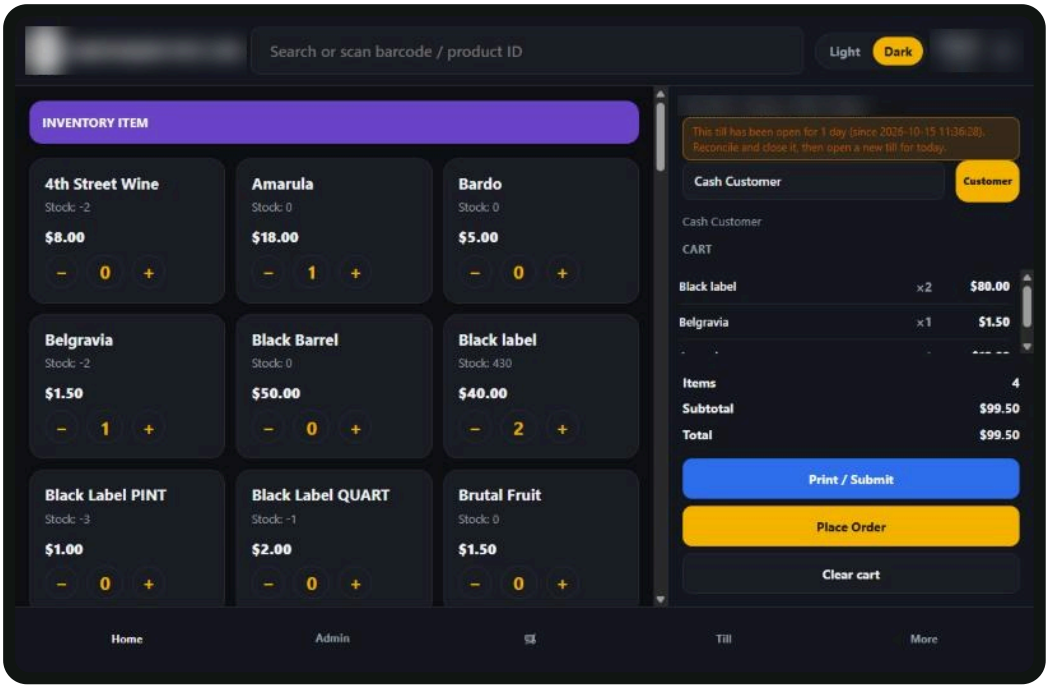

Stock, prices, users, customers and reports for all branches in one place, with each till tied to its branch.

Control over cash

Opening floats, cash in / out, counted vs expected cash, shortages and surpluses, refund approvals and an audit trail for every change.

The owner decides who sees what

Role Permissions let the Admin choose, role by role, who sees sales, who changes prices, who manages stock and who uses the phone app.

The selling screen: tap tiles, type quantities, scan barcodes.

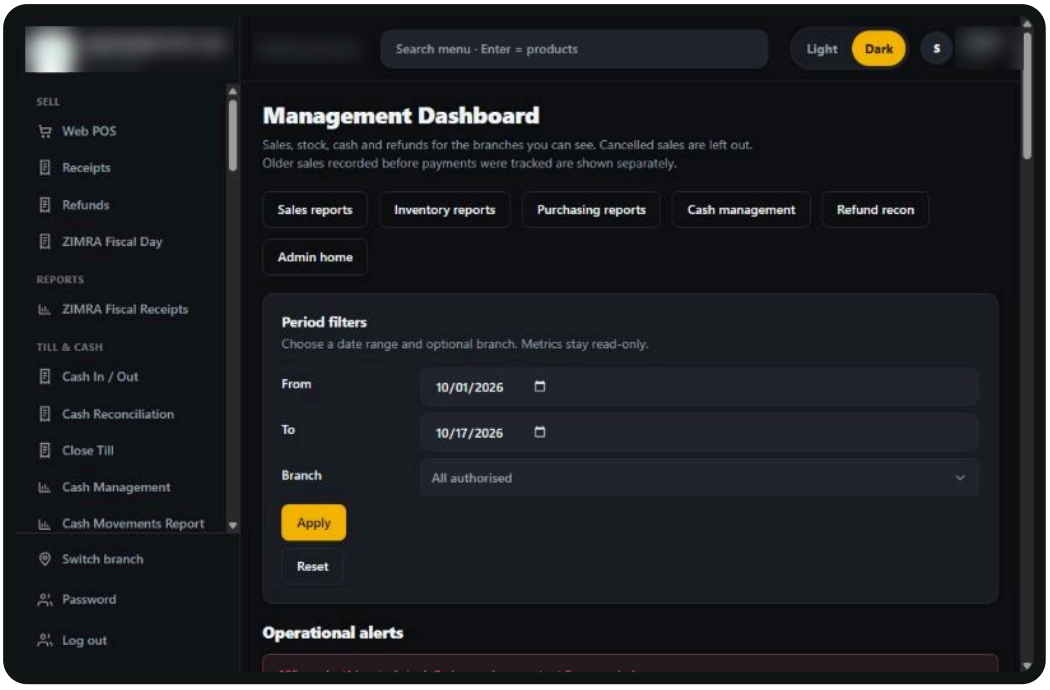

02 Who it is for

- **Retail shops, supermarkets and hardware stores**: barcode scanning, items sold by weight or length, sizes and colours, stock control and purchasing.
- **Bars, bottle stores and restaurants**: fast tile selling by button group, restaurant order numbers to call out (001, 002…), multiple tills, cash control per cashier.
- **Businesses with several branches**: stock transfers, branch reports and one head-office view.
- **Any VAT-registered business that must fiscalise with ZIMRA**.

03 What is included

AREA	FEATURES
Selling	Touch-friendly tiles, +/− and typed quantities, barcode scanning, weighed items, variants, packs and single units, customer selection, View Ticket to check and edit the order with the customer, quick cash buttons, cash / card / EcoCash / bank / account / other payments, receipt printing with the company's own logo, restaurant order numbers, storeroom picking slips, refunds with approval.
ZIMRA	Device registration per branch, automatic fiscal day, fiscal invoices and credit notes, QR code and verification code on receipts, offline signing with automatic resend, fiscal receipts report.
Currencies	Sell, buy and take payments in USD, ZiG and other currencies. Each company has a base currency for reports; managers enter dated exchange rates, every sale keeps the rate it used, tills count each currency separately, and ZIMRA receipts are issued in the sale currency.
Cash	Till sessions with opening float, cash in / out, reconciliation, close till, cash management dashboard, closure and audit reports.
Stock	Opening stock (also straight from the Excel import), goods receipts with printable GRVs (A4 or slip), purchase orders and returns, adjustments with reasons, branch transfers, stock take on the web or the phone, Stock Take Records with shortages and surpluses in value, low-stock alerts, stock value.
Customers	Customer list, credit accounts with limits, account payments, statements, ageing and credit control.
Reports	Management dashboard, sales by branch / cashier / product / payment method, Z report, inventory, tax, purchasing, income statement, refund reconciliation. CSV and PDF export.
Admin	Users with four roles and Role Permissions to choose what each role may do, tax rates, button groups and colours, Excel product import, barcode labels, bulk price changes, backups, security audit.

AREA	FEATURES
Phone app	Sell, receive goods, take stock and transfer between branches from an Android phone, with or without internet. The Admin chooses which roles may use it.
Several companies	One server runs many client companies. Each company only ever sees its own sales, stock, customers, expenses and reports, even when two companies use the same branch name.
Windows till	Offline selling, automatic sync, receipt printers (driver, ESC/POS, network), cash drawer, several tills on a shop network, automatic backups, one-click updates, custom colours.

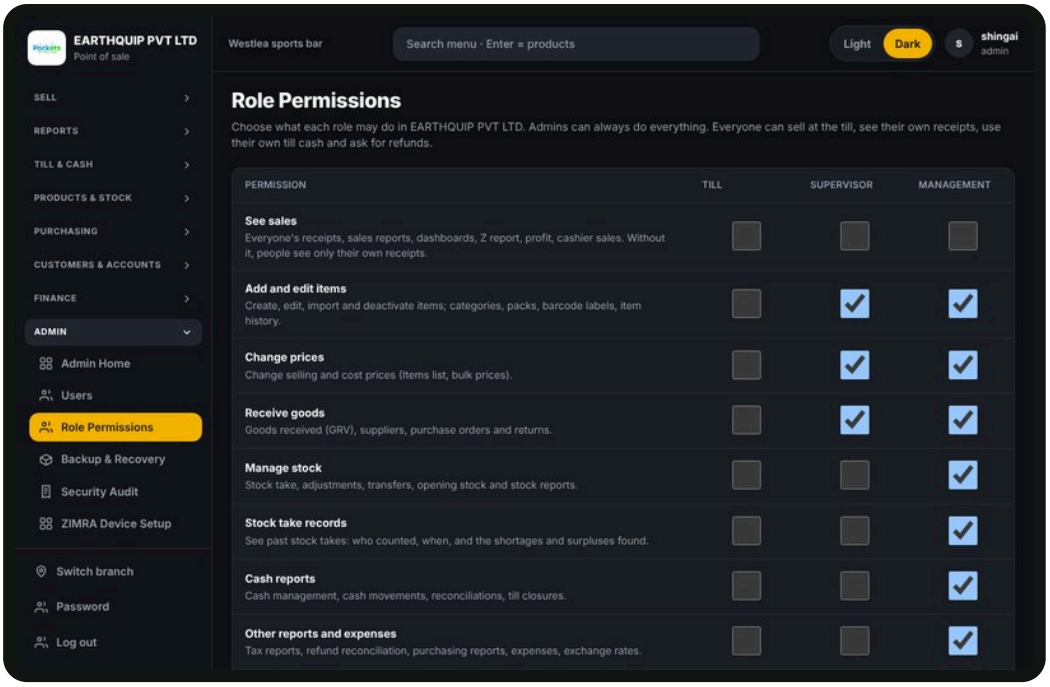

Management Dashboard.

04 Roles in the system

ROLE	WHO IT IS FOR	WHAT THEY CAN DO (OUT OF THE BOX)
Till	Cashiers	Sell, print and see their own receipts, ask for refunds, cash in / out, count the till and close it. Own branch only.
Supervisor	Shift leaders	What a Till user can do, plus add and edit items, change prices, receive goods (GRV), manage customers, approve refunds and run the ZIMRA fiscal day. **Does not see sales**.
Management	Shop managers	What a Supervisor can do, plus stock control (stock take, adjustments, transfers), Stock Take Records, cash reports and other reports. **Does not see sales**.
Admin	The business owner or administrator	Everything, always: sales, products, stock, purchasing, customers, users, Role Permissions, tax rates, ZIMRA devices, backups and desktop tills.
Super Admin	Pocket Solutions (the provider)	Sets up companies and branches and publishes desktop till updates. Never sells or refunds.

This is the starting point. The Admin can change what Till, Supervisor and Management may do, including who sees sales and who may use the phone app, on **Admin › Role Permissions** (see the Admin chapter). Only Admins can use the phone app until the Admin allows other roles.

Each user sees only what their role allows. The table shows the starting point; the business owner can change it on **Role Permissions**, for example to let a trusted manager see sales or a supervisor use the phone app. Out of the box, nobody but the Admin sees everyone's sales.

Role Permissions: the Admin ticks what each role may do.

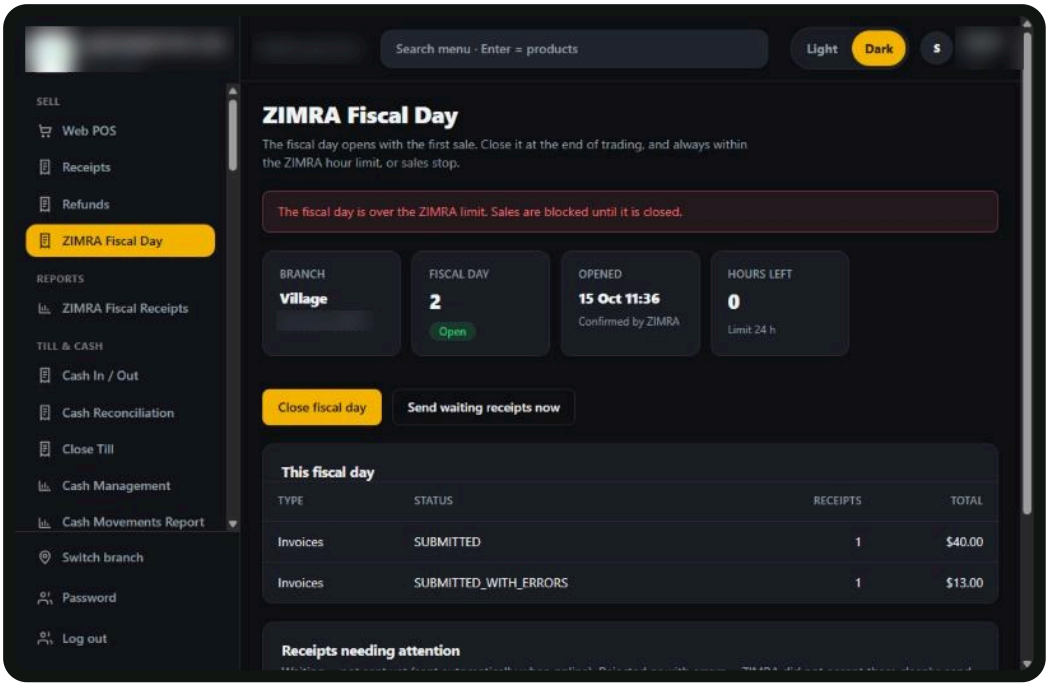

05 Why offline matters

Internet and power cuts are a fact of trading. Pockets POS is built so neither one costs a sale:

- The Windows till keeps a full copy of products, prices, users and customers. Cashiers sign in and sell with no connection.
- Each completed sale is written to the PC's disk immediately, so a power cut does not lose it.
- Sales go up to the web system automatically when the connection returns. Head office sees them without anyone pressing a button.
- ZIMRA receipts are signed on the till and sent when ZIMRA is reachable. The fiscal day stays within ZIMRA's rules.

06 Running a demo

1. **Start on the selling screen.** Ring up three items: tap a tile, tap + again, then tap the number and type 12. Scan a barcode if you have a scanner.
2. **Take payment** with Cash and show the change, then show the receipt with the ZIMRA QR code.
3. **Request a refund** as the cashier, then approve it as a supervisor: it shows the control owners want.
4. **Open the ZIMRA Fiscal Day page**: the day opened by itself; show hours left and the close button.
5. **Show the Management Dashboard and Z Report**: today's sales by cashier, cash expected vs counted.
6. **Open Role Permissions**: untick *See sales* for Management and show that a manager's menu loses the sales pages. Owners like this control.
7. **Do a quick stock take** on one item and show it in **Stock Take Records** with the shortage valued at cost.
8. **Unplug the network** on the Windows till and keep selling. Reconnect and show the sales arriving on the web.

ZIMRA Fiscal Day.

07 What a customer needs

- **Web system**: any modern browser (Chrome, Edge, Firefox) on a PC, tablet or phone.
- **Windows till**: Windows 10 or 11, 64-bit. No internet needed to sell; internet for syncing and ZIMRA.
- **Receipt printer**: any Windows printer; 58 mm or 80 mm thermal printers (Epson, Xprinter, Rongta, Bixolon and compatibles) for fast ESC/POS printing and paper cut. USB or network.
- **Cash drawer**: one that plugs into the receipt printer.
- **Barcode scanner**: any USB scanner that types like a keyboard.
- **ZIMRA**: a fiscal device registered on the ZIMRA FDMS portal for each branch (device ID, serial number, activation key).
- **Recommended**: a small UPS for the till PC.

08 Setting up a new customer

1. Pocket Solutions creates the company and its first Admin.
2. Pocket Solutions sets the company's base currency and the currencies it may use (Platform › Currencies); the Admin or a manager adds the exchange rates (Finance › Exchange Rates).
3. Pocket Solutions adds the company's branches. The Admin adds users, tax rates and button groups, and sets **Role Permissions** (including who may use the phone app).
4. Import products from the Excel template, with their opening stock in the **Opening Stock** column. Upload the company logo for A4 receipts on the Receipts page.
5. Register each branch's ZIMRA device (test first, then production).
6. Install the Windows till on each counter PC and pair it with a code from Desktop Tills.
7. Connect the receipt printer and cash drawer in Till Settings and print a test receipt.
8. Train cashiers on the daily routine: open, sell, reconcile, close. Train supervisors to close the ZIMRA fiscal day every evening.

09 Common questions from customers

Does it work with ZIMRA fiscalisation?

It connects to ZIMRA's Fiscal Device Management System (FDMS) as a fiscal device for each branch, issues fiscal invoices and credit notes, and manages fiscal days as ZIMRA requires. Each device is registered and tested on the ZIMRA test environment before going live.

What happens when the internet goes down?

The Windows till keeps selling, printing and fiscalising. Everything syncs when the connection returns.

Can we have more than one till?

Yes, as many as you need per branch. Tills in one shop can also share sales and stock over the local network.

Where is our data kept?

On the web server for the whole business, and a working copy on each Windows till. Both are backed up automatically.

Can staff steal or hide sales?

Every sale is numbered and fiscalised, refunds need approval, cash is reconciled per session, and price, stock and user changes are logged.

Can I stop managers seeing our sales figures?

Yes. Out of the box only the Admin sees everyone's sales. The Admin chooses on Role Permissions which roles may see sales, change prices, manage stock, refund without a second approver, or use the phone app.

We share a server with other businesses. Can they see our data?

No. Every report, list and export shows only your company's records, and the phone app and Windows tills only ever receive your company's data.

How do updates work?

New versions of the Windows till are published centrally. Tills update with one click, from the internet or a USB stick.
