USER MANUAL · WEB SYSTEM AND WINDOWS TILL

Pockets POS User Manual

Step-by-step guide for cashiers, supervisors, managers and administrators.

Pockets POS is a point of sale and back office for shops, bars, hardware stores and other retailers in Zimbabwe. It sells, keeps stock, manages cash and customers, and issues ZIMRA fiscal receipts. This manual walks every user through the system, one role at a time.

Web system

Runs in any browser. The back office for managers and admins, plus the **Web POS** selling screen.

Windows desktop till

Pockets POS for Windows. Sells with or without internet and sends its sales to the web system when it is online.

ZIMRA fiscalisation

Every sale is a signed fiscal invoice and every refund a credit note, sent to ZIMRA automatically.

Who does what

ROLE	WHO IT IS FOR	WHAT THEY CAN DO (OUT OF THE BOX)
Till	Cashiers	Sell, print and see their own receipts, ask for refunds, cash in / out, count the till and close it. Own branch only.
Supervisor	Shift leaders	What a Till user can do, plus add and edit items, change prices, receive goods (GRV), manage customers, approve refunds and run the ZIMRA fiscal day. **Does not see sales**.

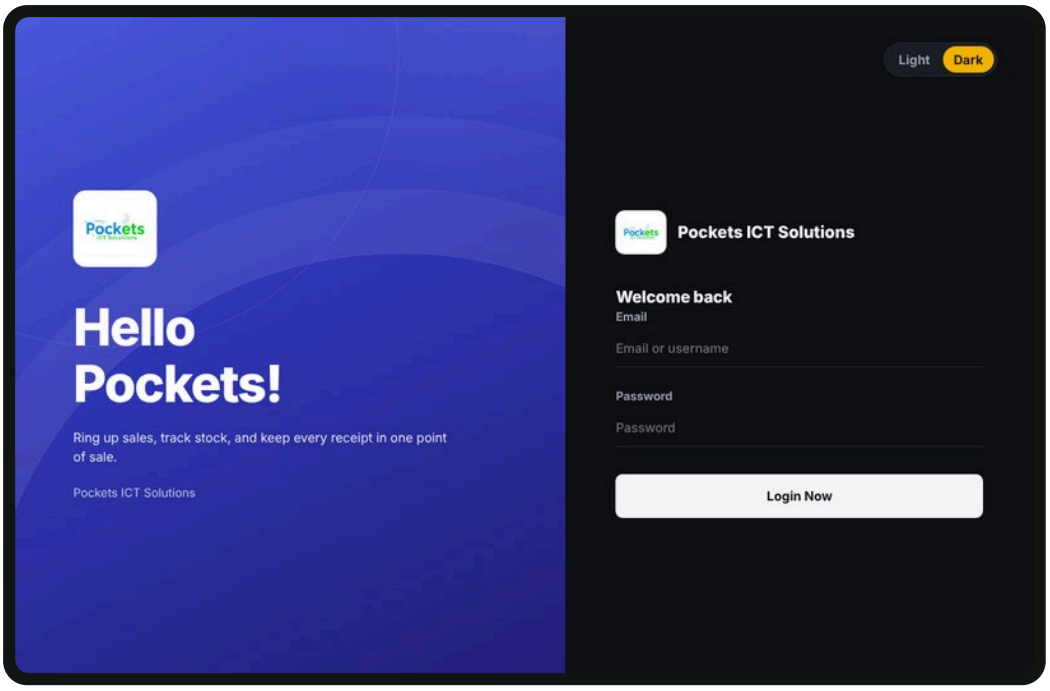

ROLE	WHO IT IS FOR	WHAT THEY CAN DO (OUT OF THE BOX)
Management	Shop managers	What a Supervisor can do, plus stock control (stock take, adjustments, transfers), Stock Take Records, cash reports and other reports. **Does not see sales**.
Admin	The business owner or administrator	Everything, always: sales, products, stock, purchasing, customers, users, Role Permissions, tax rates, ZIMRA devices, backups and desktop tills.
Super Admin	Pocket Solutions (the provider)	Sets up companies and branches and publishes desktop till updates. Never sells or refunds.

This is the starting point. The Admin can change what Till, Supervisor and Management may do, including who sees sales and who may use the phone app, on **Admin › Role Permissions** (see the Admin chapter). Only Admins can use the phone app until the Admin allows other roles.

01 Getting started EVERYONE

Signing in

1. Open the web address your administrator gave you in Chrome, Edge or any modern browser.
2. Enter your **email or username** and your **password**, then press **Login Now**.
3. Till users go straight to the selling screen. Everyone else lands on **Admin Home**.

The sign-in page. Use Light or Dark at the top right to change the colours.

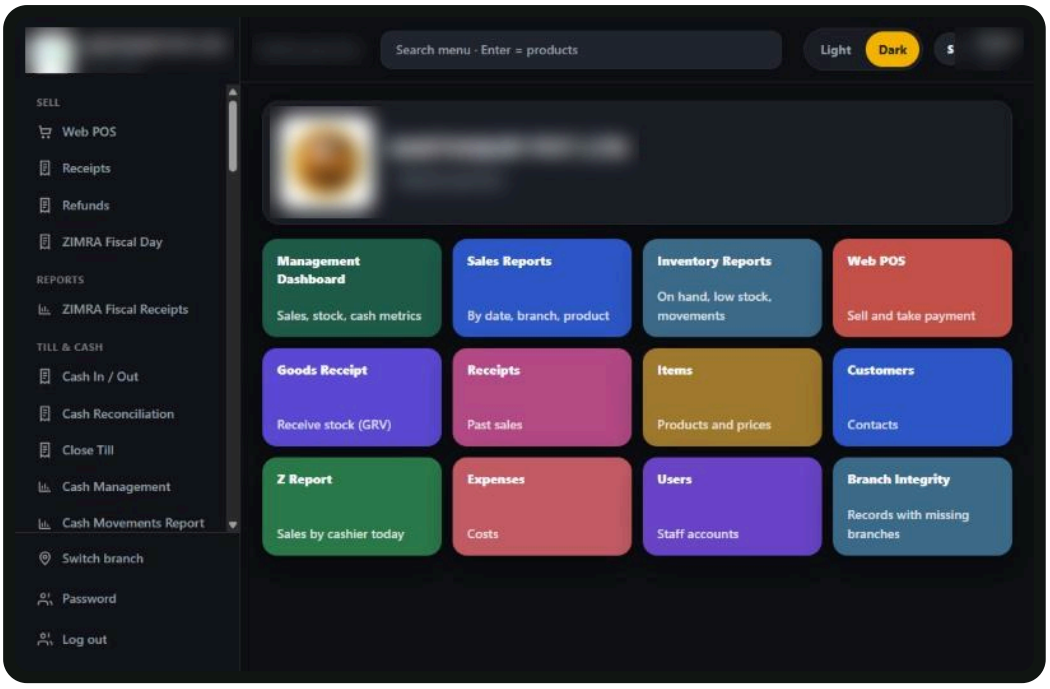

Security. After 5 wrong passwords the account is paused for 15 minutes. You are signed out after 10 minutes without activity. Change your password any time from **Password** at the bottom of the menu.

Finding your way around

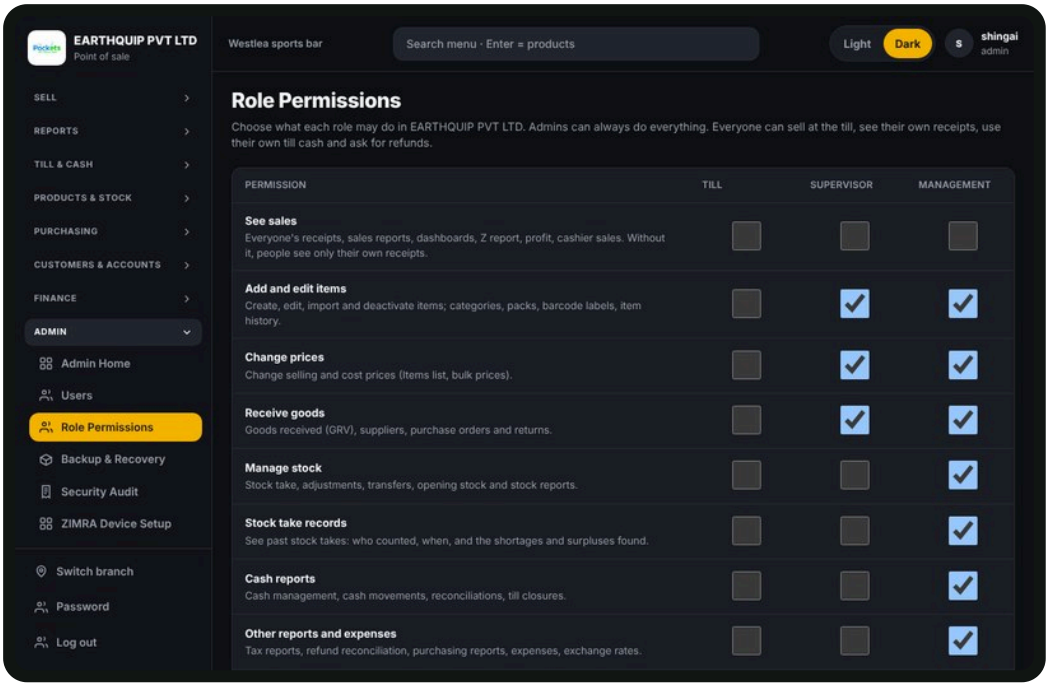

The menu on the left groups the pages into sections: **Sell**, **Reports**, **Till & Cash**, **Products & Stock**, **Purchasing**, **Customers & Accounts**, **Finance** and **Admin**. You only see the pages your role allows.

- **Click a section name** to open or close it, like a dropdown. The section of the page you are on is always open. The menu remembers which sections you opened.

- **Search menu** at the top finds any page by name. Type a product name and press Enter to search products.
- **Switch branch** changes the branch you are working in, for users allowed more than one branch.
- The tiles on **Admin Home** are shortcuts to the most used pages.

Admin Home with the shortcut tiles and the menu on the left. (Company details blurred.)

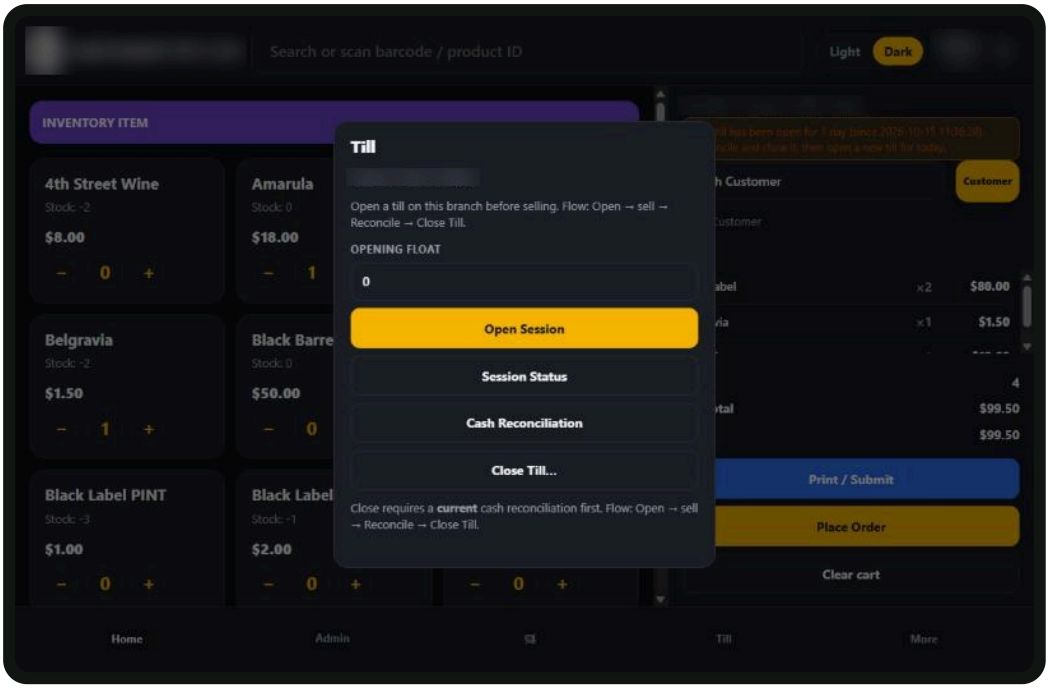

The menu with its sections: Admin is open, the others are closed. (This page is Role Permissions.)

02 Selling at the till TILL

This chapter is for cashiers. The same steps work on the **Web POS** and on the **Windows desktop till**.

1. Open the till

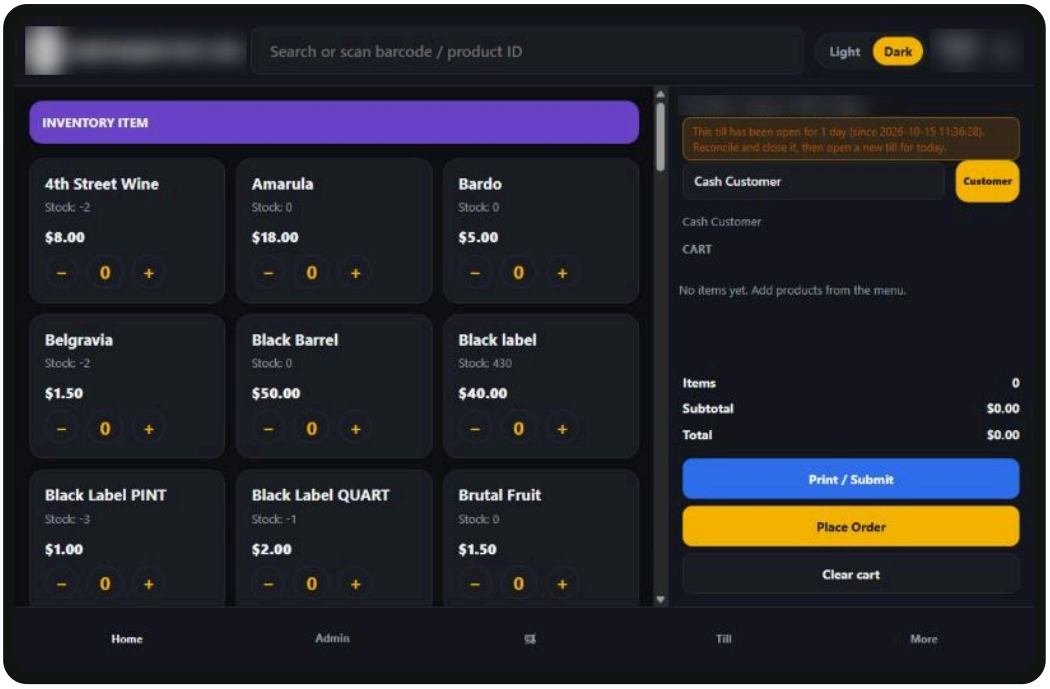

1. Open **Web POS** from the menu.
2. Tap **Till** at the bottom of the screen.
3. Count the cash in the drawer and enter it as the **Opening float**, then tap **Open Session**.

The Till menu: open a session with the opening float, check its status, reconcile and close.

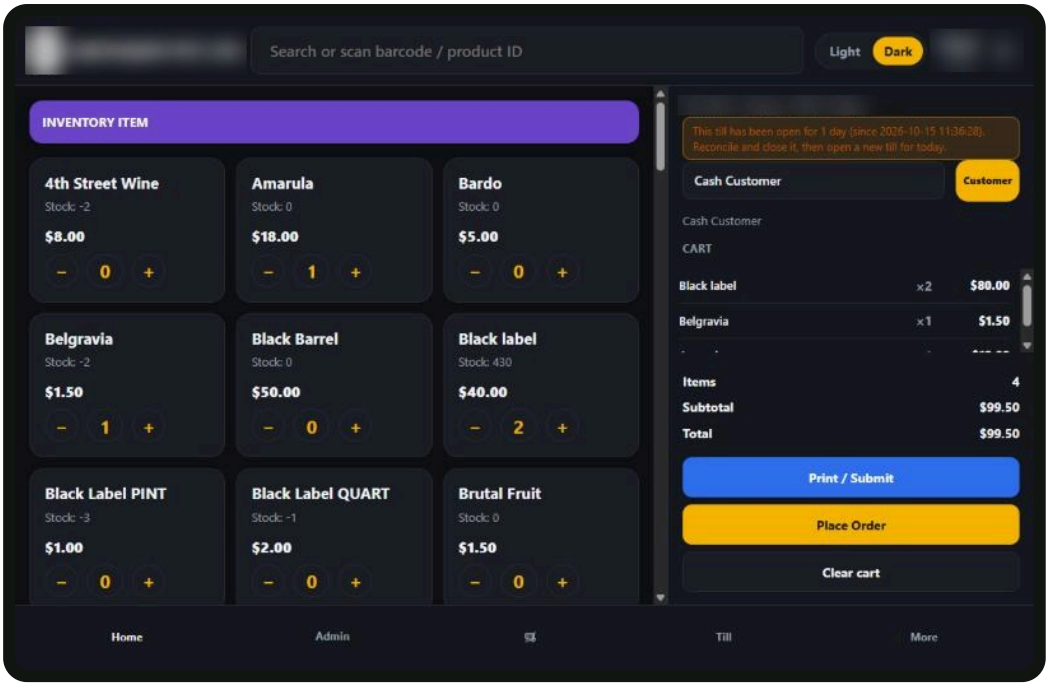

> The daily routine is always: **Open → Sell → Reconcile → Close**. If a till is left open overnight the screen reminds you to reconcile and close it.

2. Ring up a sale

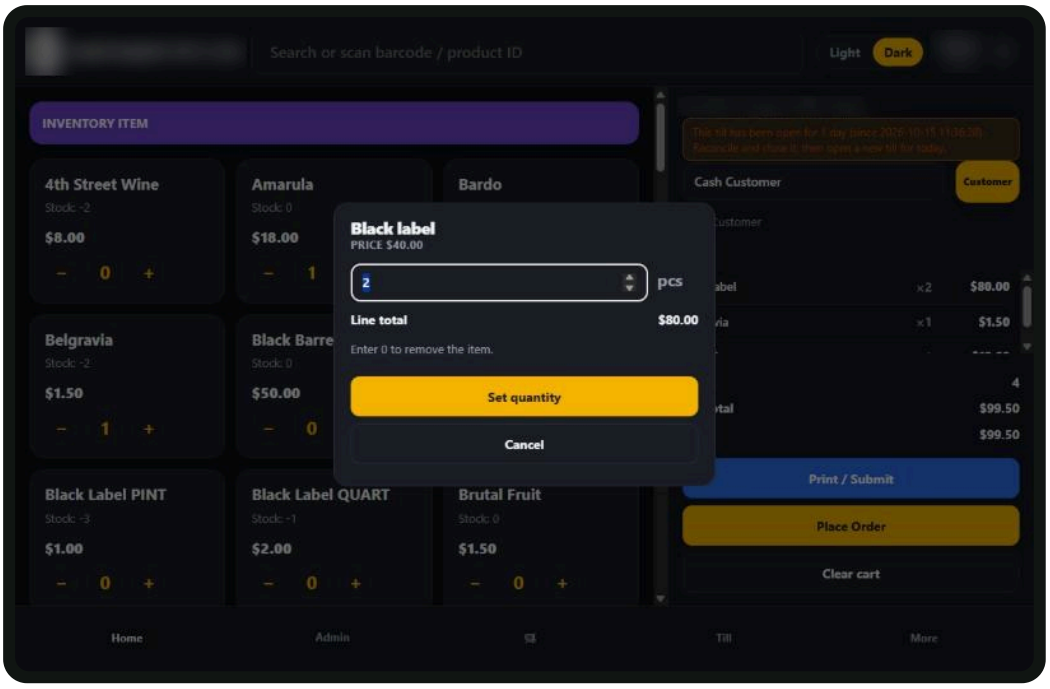

The selling screen: product tiles on the left, the order on the right. Group buttons at the top filter the tiles.

- **Tap +** on a product tile to add one. **Tap −** to take one away.
- **Tap the number** between − and + to **type a quantity**, e.g. 12. Enter 0 to remove the item.
- **Search or scan**: type a name, product ID or barcode in the box at the top, or scan the barcode.
- Items sold by weight or length (kg, m, litres) always ask for the amount, e.g. 1.25 kg.
- Items with sizes or colours open a picker so you can choose the right one.
- **Packs**: an item sold both singly and in packs (a bag of sugar, or a pack of 10 bags) shows a row for each pack on its tile with its own price and +/−. The order shows what you sold, for example "1 pack (10 bags)". Scanning a pack's barcode adds a whole pack. Packs are sold whole; for part of a pack, sell single units.
- The tile shows stock in both units, for example "109 bags = 10 packs + 9 bags". When only 9 bags are left, a pack is refused but you can still sell the 9 bags.

Four items in the order. The totals update as you add items.

Tap the quantity to type it. "Set quantity" saves it; 0 removes the item.

3. Choose the customer (optional)

Sales go to **Cash Customer** unless you pick someone. Tap **Customer**, search by name, phone or code, and choose them. To sell on account (credit), the customer needs an active customer account.

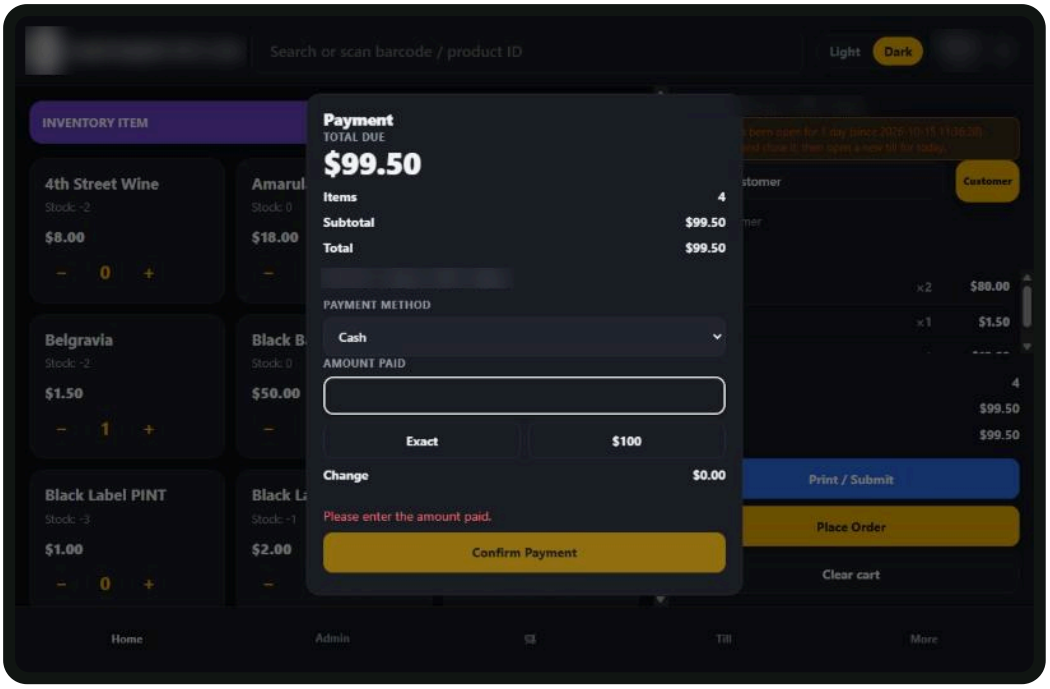

4. Check the order with the customer (View Ticket)

View Ticket shows the order the way the customer will pay for it. On the ticket you can still **add (+), reduce (−) or remove** an item; the totals update straight

away. Payment is only taken for the order as confirmed on the ticket.

5. Take payment

1. Tap **Print / Submit** or **Place Order**. The payment screen opens.
2. Choose the **payment method**: Cash, Card, EcoCash, Bank transfer, Account (credit) or Other.
3. Enter the **amount paid**, or tap **Exact** or one of the **quick cash buttons**. They suggest the notes a customer is likely to hand over for that total, in the sale's currency (for $13.50: $15, $20, $50…). The change is shown.
4. Tap **Confirm Payment**. The receipt prints, with the ZIMRA QR code and verification code when the branch is fiscalised.

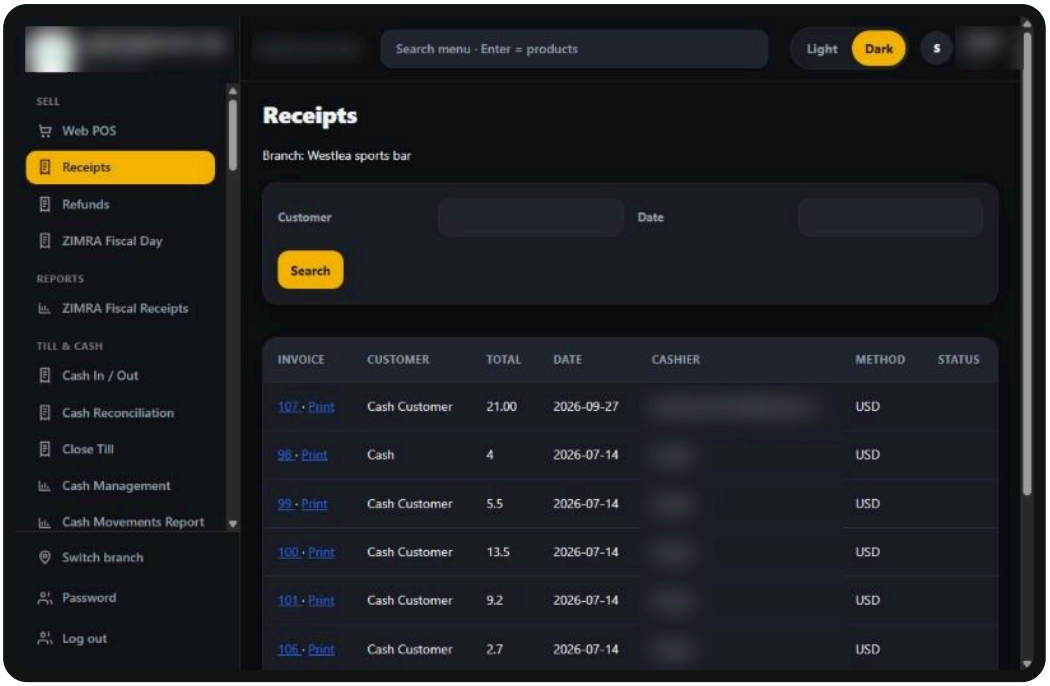

The payment screen. Card, EcoCash and bank payments can carry a reference number.

Restaurant order numbers. When your Admin turns them on, every sale gets a short order number to call out, printed big on the receipt and shown when the sale is done, for example **W01-001**. Numbers start at 001 each time a till is opened. Web tills use W01, W02…, Windows tills their till code (T01-001) and phones M01-001.

6. Reprint a receipt

Open **Receipts**, search by customer or date, and tap **Print** next to the invoice. You see your own receipts; people allowed to see sales see everyone's. A reprint may

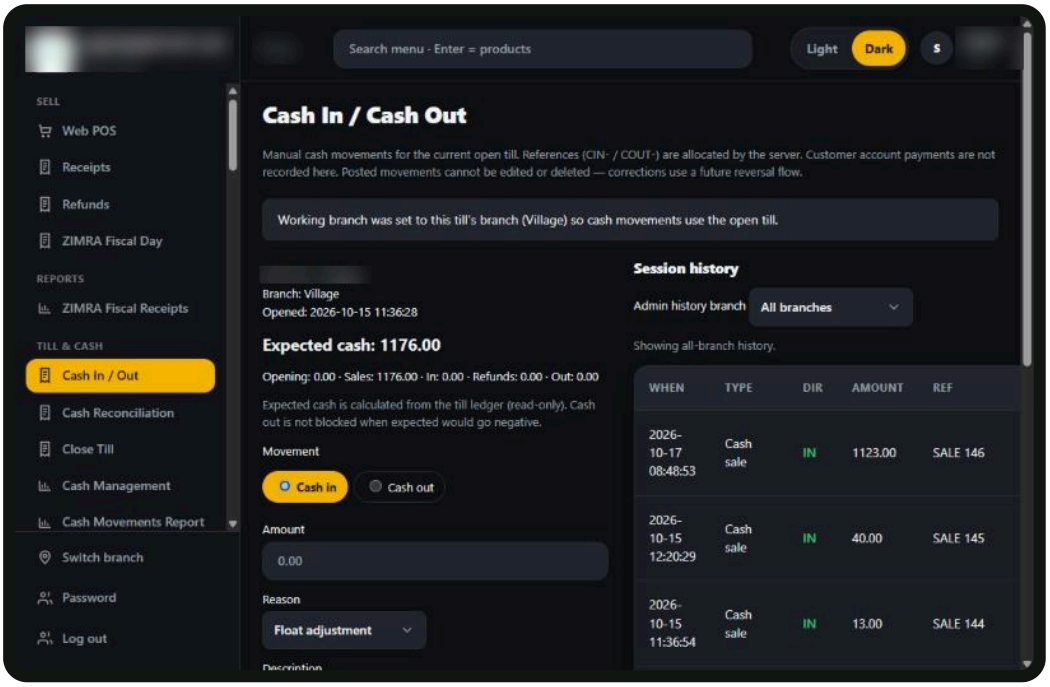

need a supervisor's approval, unless your Admin has allowed your role to reprint on its own.

Past receipts for the branch. (Staff details blurred.)

7. Cash in and cash out

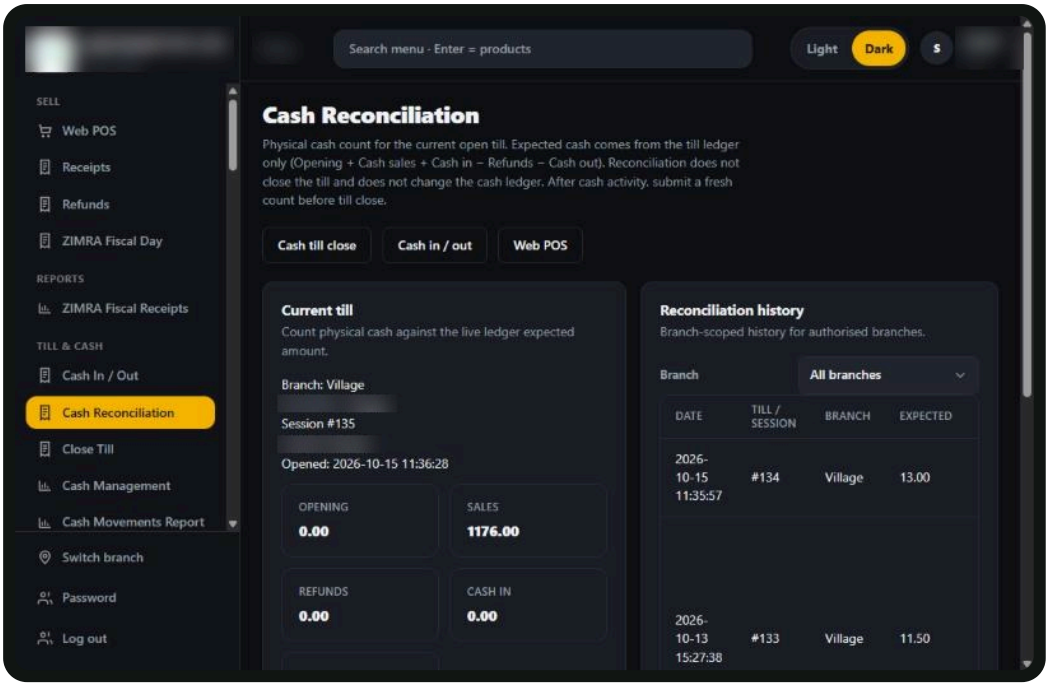

Use **Cash In / Out** for money added to or taken out of the drawer that is not a sale: float top-ups, cash drops to the safe, small payments. Choose Cash in or Cash out, enter the amount and reason, and save. Movements cannot be edited afterwards, so check before saving.

Cash In / Out shows the expected cash in the drawer and the session's history. (Names blurred.)

8. Count the till (reconciliation)

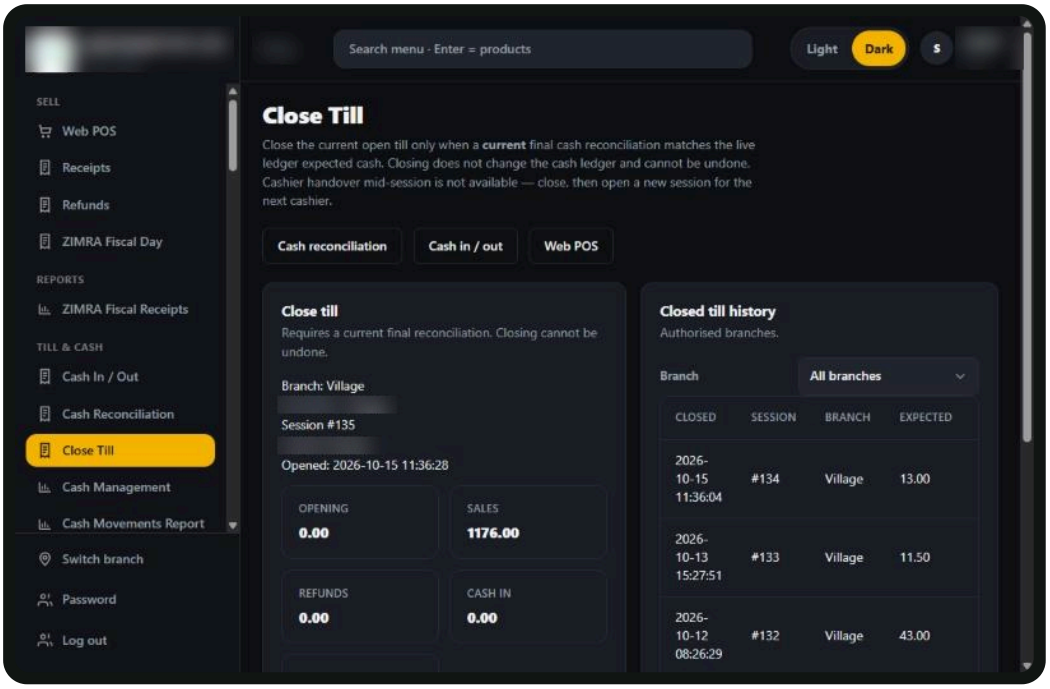

Before closing, count the cash and enter it on **Cash Reconciliation**. The system compares your count with the expected cash: opening float + cash sales + cash in − cash refunds − cash out. Any shortage or surplus is recorded.

Cash Reconciliation for the open till. (Names blurred.)

9. Close the till

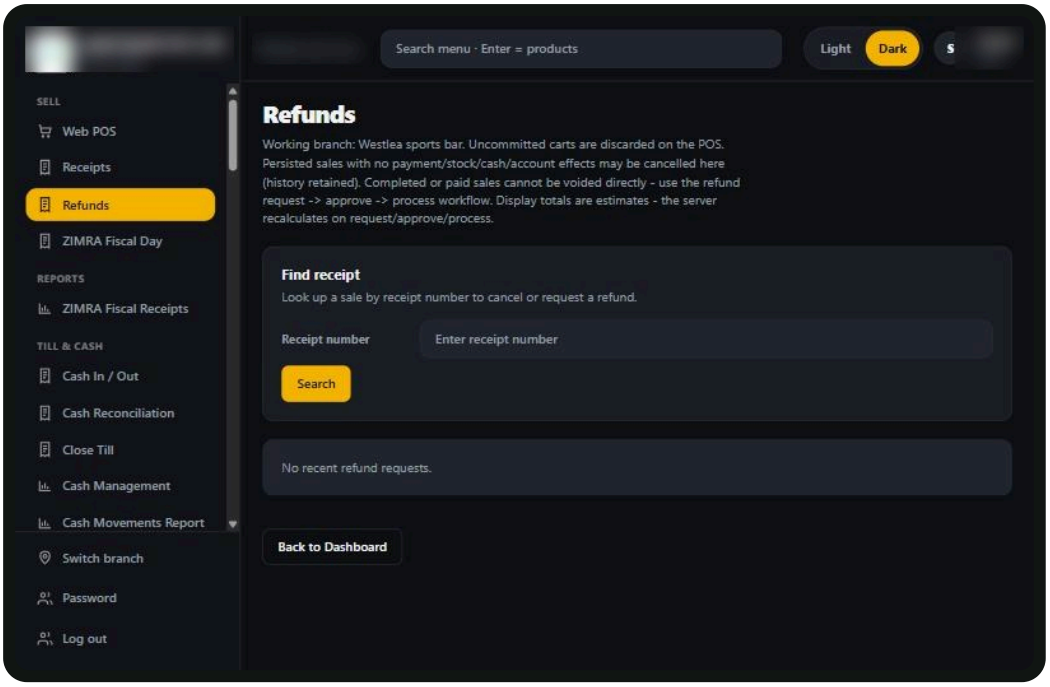

Open **Close Till** and confirm. Closing needs a current reconciliation, and it cannot be undone. The next cashier opens a new session.

Close Till with the closed-till history on the right. (Names blurred.)

10. Ask for a refund

1. Open **Refunds** and enter the **receipt number**.
2. Choose the items and quantities being returned and send the request.
3. A Supervisor, Manager or Admin approves it and processes the refund. Cash refunds come out of the till; stock goes back on the shelf; a ZIMRA credit note is issued.

Refunds: look up the receipt to start a request.

03 Supervisor tasks SUPERVISOR

Approving refunds

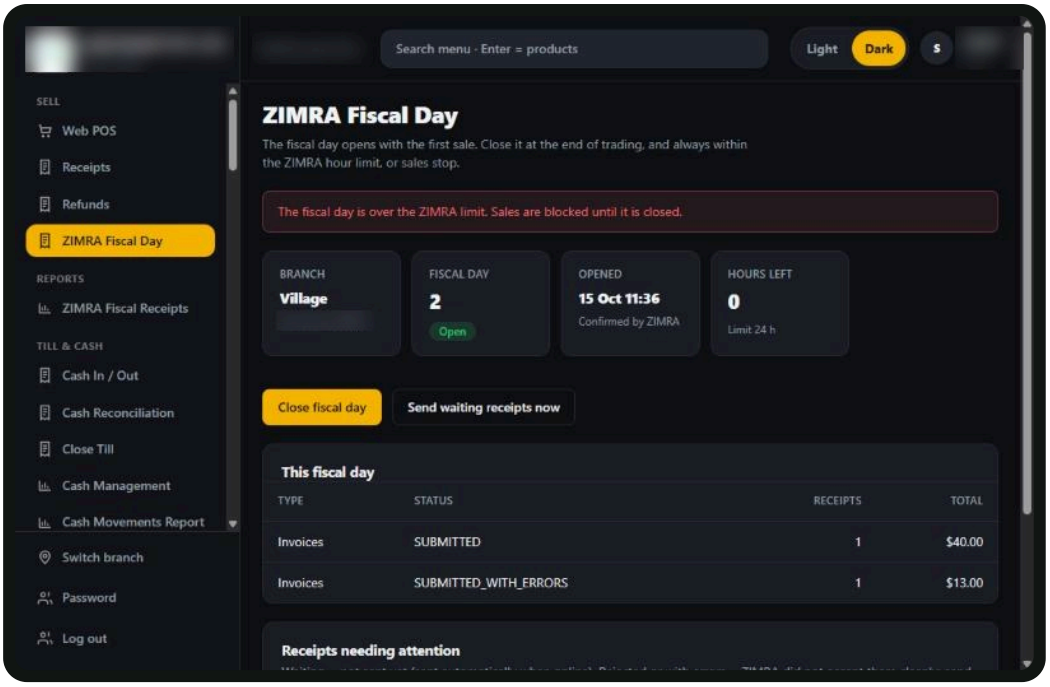

Every refund goes **Request → Approve → Process**. Open **Refunds**, open the waiting request, check the items, and choose **Approve** (with a note) or **Reject**. Then **Process** it to pay the customer and return the stock. Quantities are locked once approved; to change them, reject and ask for a new request.

Normally someone else must approve a refund you asked for yourself. If your Admin has allowed your role to **refund without approval**, you can approve and process your own requests.

The ZIMRA fiscal day

ZIMRA requires every fiscal device to work in **fiscal days**. Pockets POS handles most of this for you:

- The fiscal day **opens automatically** with the first sale. Nobody has to open it.
- **Close the fiscal day at the end of trading**, every day, from **ZIMRA Fiscal Day** › **Close fiscal day**.
- The page shows the day number, when it opened and the **hours left** before ZIMRA's limit (usually 24 hours). The status bar warns in the last 3 hours.
- If the day reaches the limit, sales stop until it is closed. ZIMRA does not allow signing past the limit.
- **Send waiting receipts now** pushes any receipts that could not reach ZIMRA earlier.

ZIMRA Fiscal Day: status, hours left, the day's receipts and any that need attention.

If ZIMRA cannot be reached, keep selling. Receipts are signed on the spot, printed with their QR code, and sent automatically when ZIMRA answers again. Only closing the day has to wait until ZIMRA is reachable.

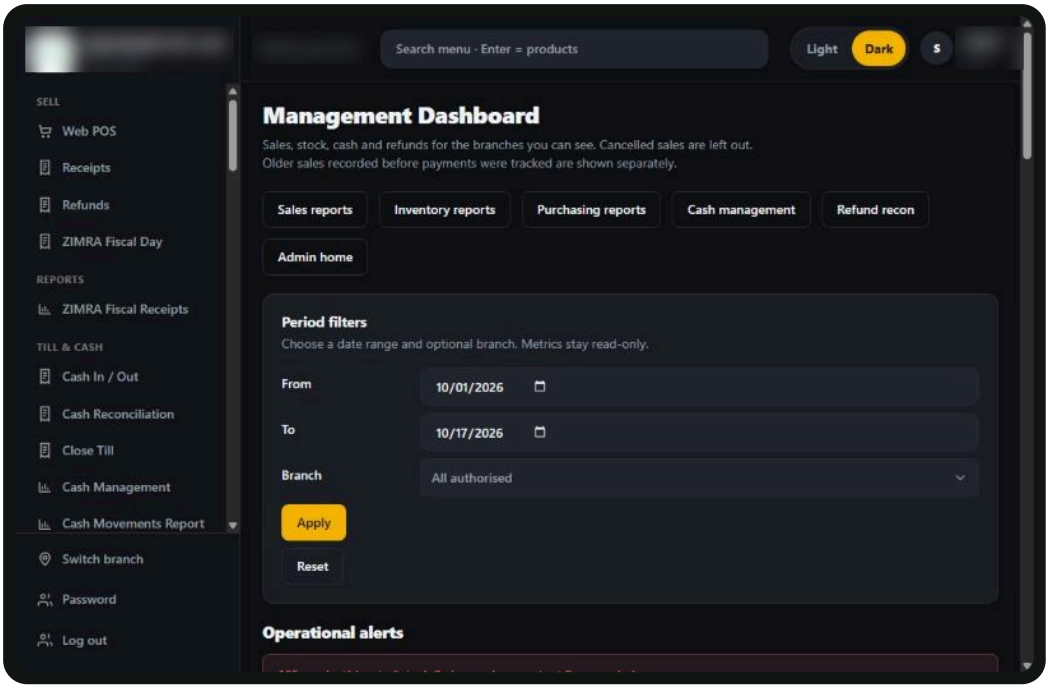

04 Reports for managers MANAGEMENT

Managers see live figures for the branches they are allowed. Reports can be filtered by date and branch, and most export to CSV, Excel or PDF. Every report shows only your own company's information.

> **Sales pages** (dashboard, Sales Reports, Z Report, profit, item sales) need the **See sales** permission. Out of the box only Admins have it; your Admin can give it to your role.

Management Dashboard

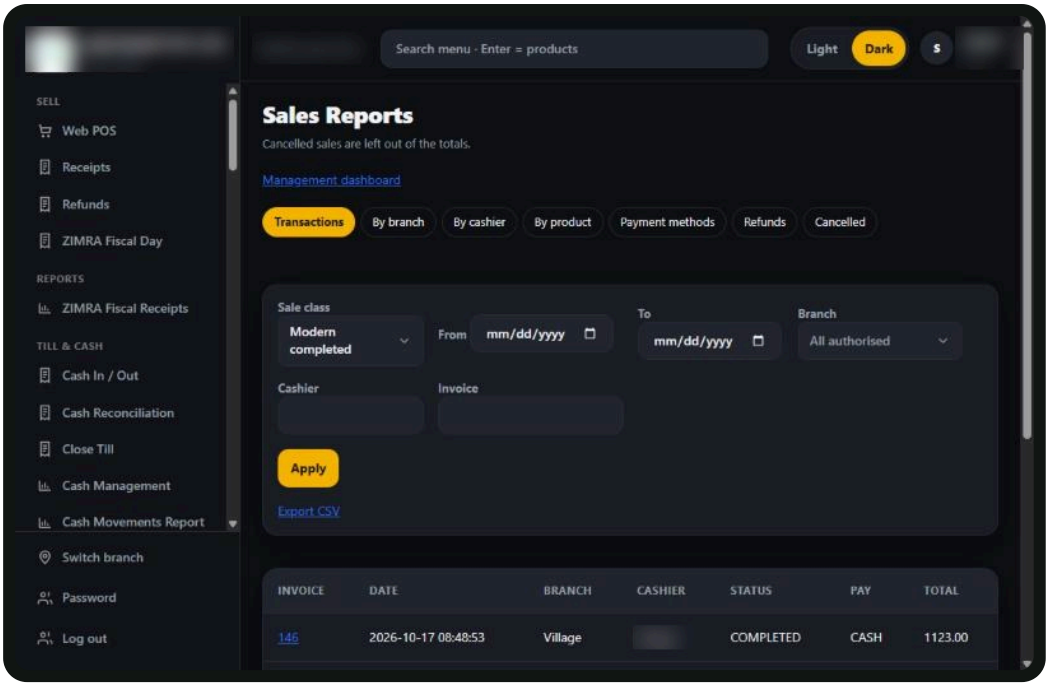

Sales, stock, cash and refunds for a period at a glance, with operational alerts such as tills left open or receipts waiting for ZIMRA.

Management Dashboard with period filters and quick links to the detailed reports.

Sales Reports

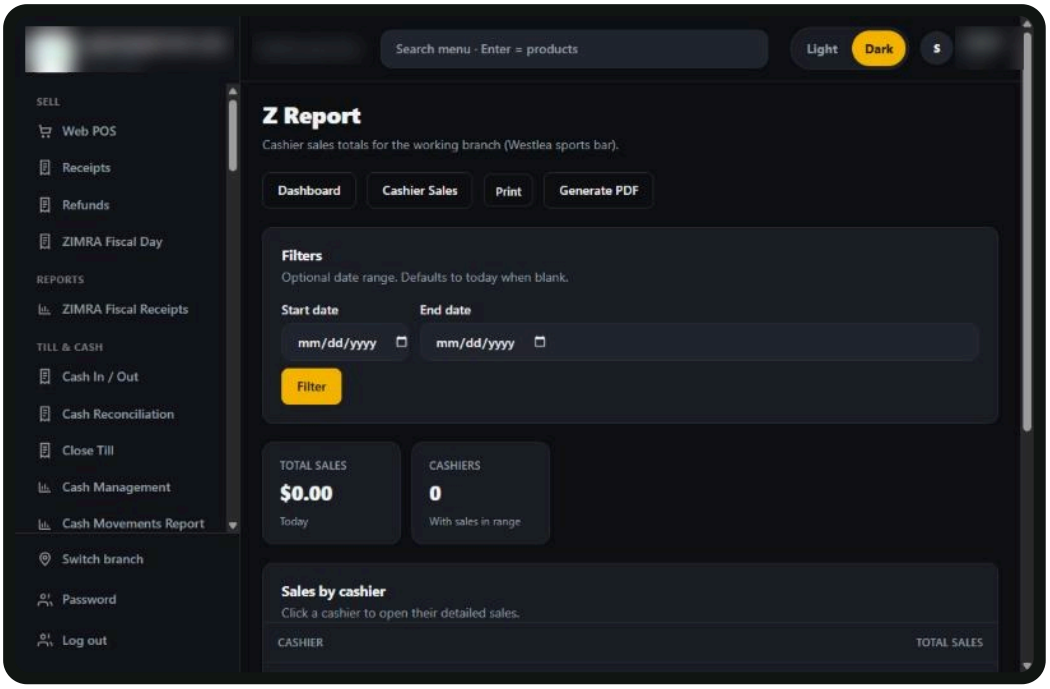

Every sale by date, branch, cashier, product and payment method, plus refunds and cancelled sales. Click an invoice to open it.

Sales Reports: switch between Transactions, By branch, By cashier, By product, Payment methods, Refunds and Cancelled. (Names blurred.)

Z Report

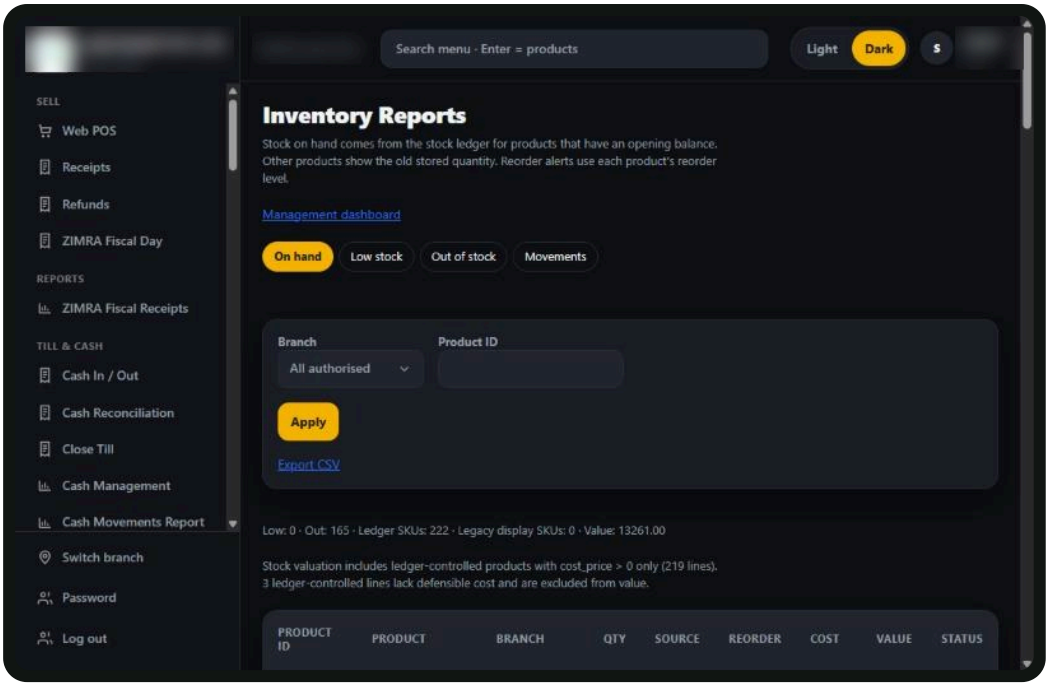

Sales by cashier for a day or date range: the end-of-day summary. Print it or save it as a PDF.

Z Report for the working branch.

Inventory Reports

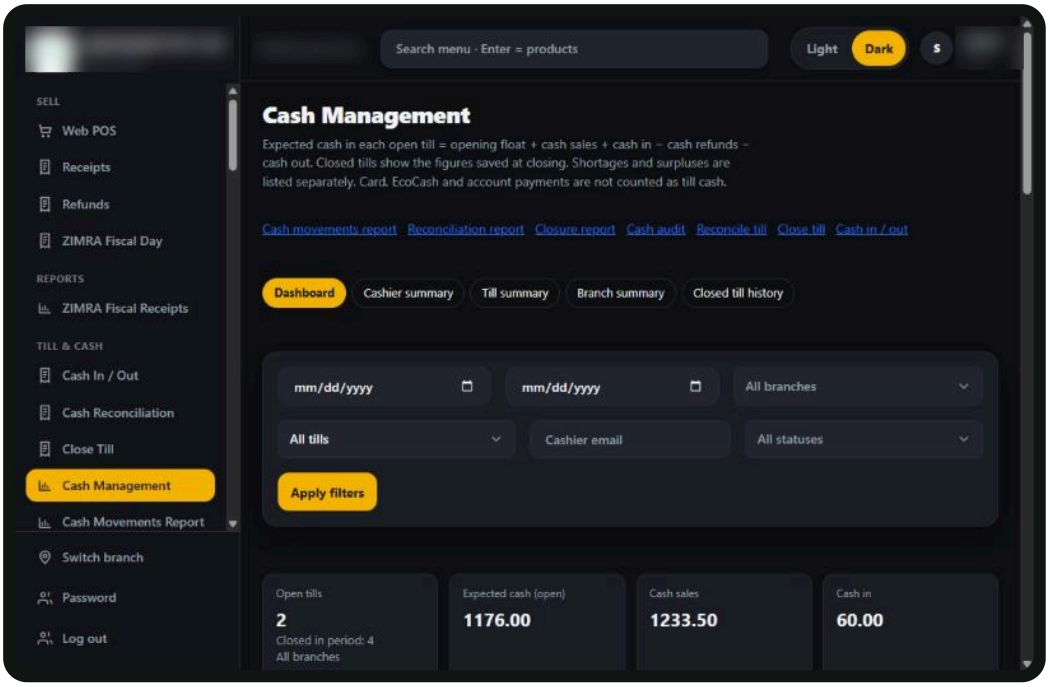

Stock on hand, low stock, out of stock and stock movements, with stock value at cost.

Inventory Reports with the stock value summary.

Cash Management

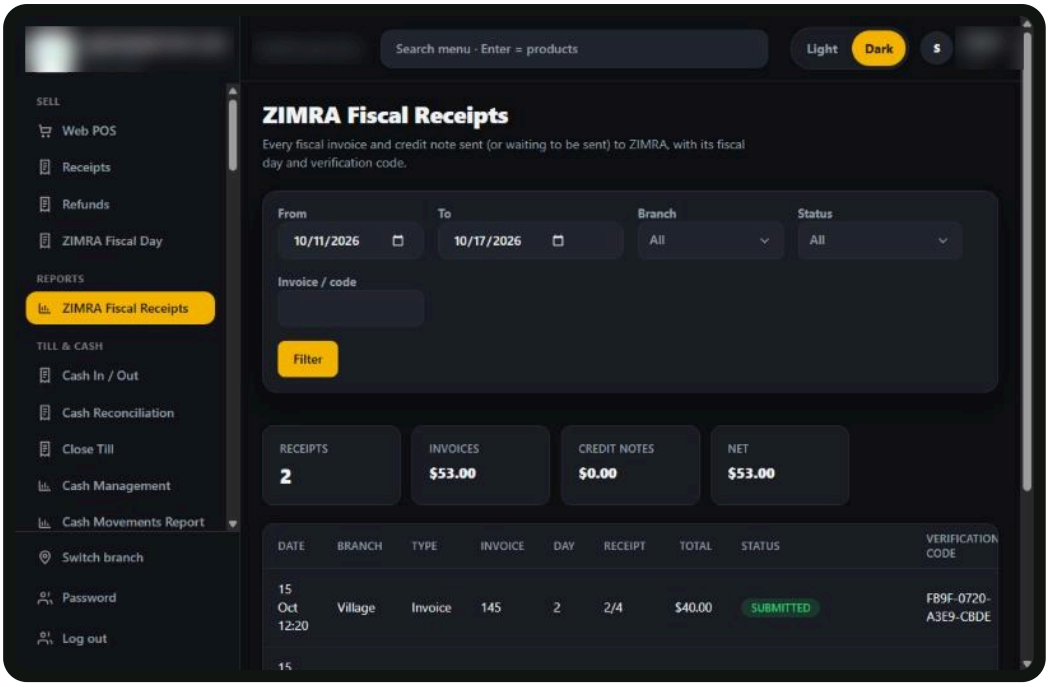

Expected cash in every open till, cash sales, cash in and out, shortages and surpluses, by cashier, till and branch. From here you also reach the Cash Movements, Reconciliation and Till Closure reports and the **Cash Audit** history.

Cash Management dashboard.

ZIMRA Fiscal Receipts

Every fiscal invoice and credit note with its fiscal day, receipt number, status at ZIMRA and verification code.

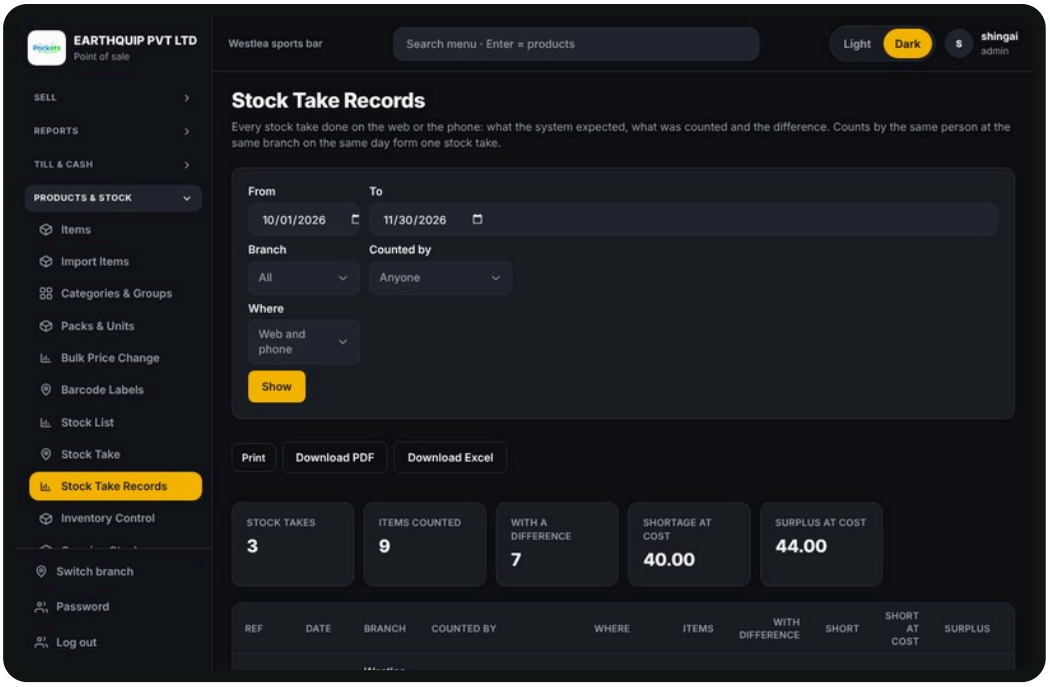

ZIMRA Fiscal Receipts for a date range.

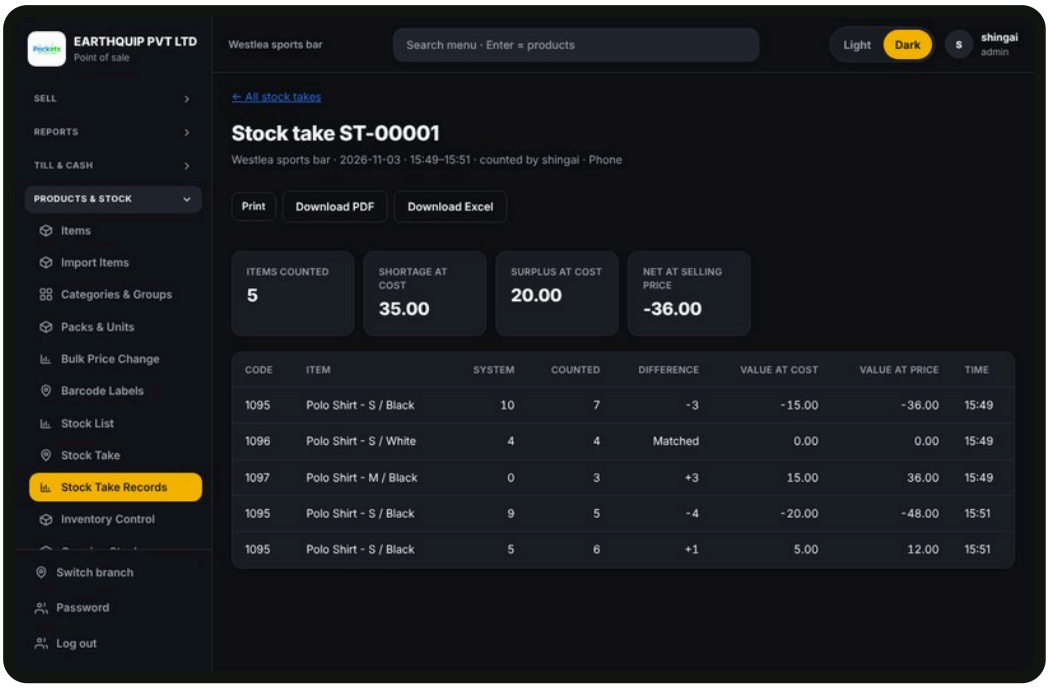

Stock Take Records

Every stock take done on the web or on the phone, under **Products & Stock › Stock Take Records**. The list shows the reference (ST-00001), date, branch, who counted, web or phone, how many items were counted, how many had a difference, and the shortage and surplus in quantity and value at cost. Counts by the same person at the same branch on the same day form one stock take.

Press **View** to see every item: what the system expected, what was counted and the difference, at cost and at selling price. Items that matched show as **Matched**. Filter by date, branch, person and web or phone; print or download PDF or Excel. Stock takes done before 3 November 2026 show their differences only, marked **Before records**.

Stock Take Records: every stock take with its shortages and surpluses.

One stock take: system quantity, count and difference for each item.

> Out of the box Management and Admin can open Stock Take Records. The Admin can change this under **Role Permissions**.

Refund Reconciliation

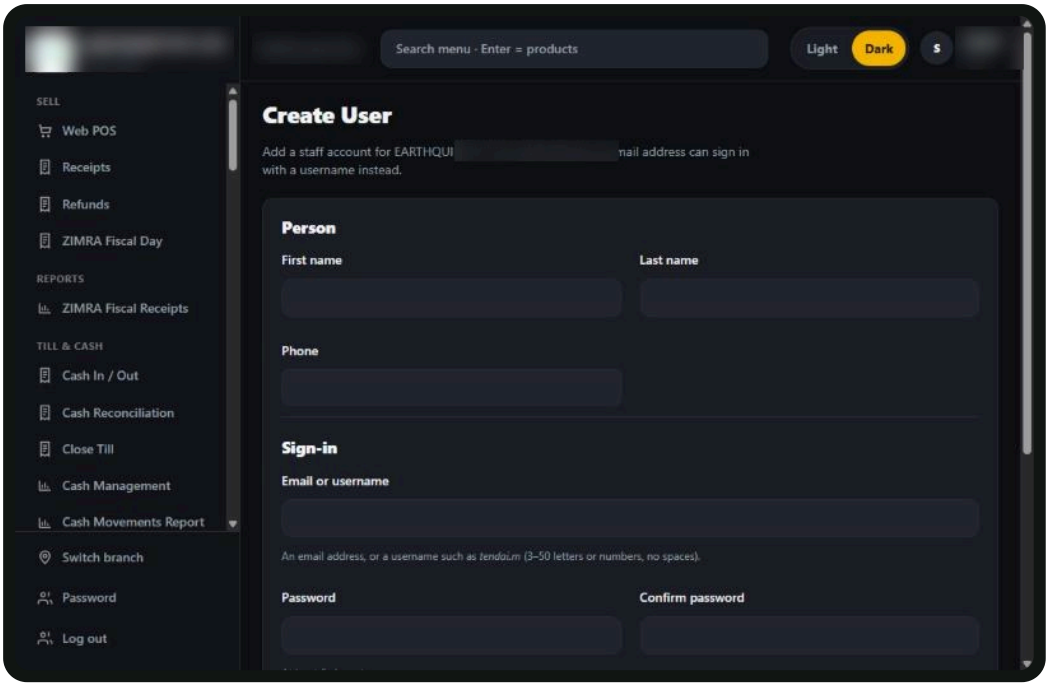

Checks that every processed refund has the matching stock return and cash refund, and lists anything that does not add up so it can be reviewed. It only reads; it never changes your records.

05 Running the business (Admin) ADMIN

Admins set the system up and keep it running. This chapter follows the order you would set up a new shop.

Users

Open **Users** › **Create user**. Enter the person's name and phone, an email address or a simple username (e.g. *tendai.m*), a password, their **role** (Till, Supervisor, Management or Admin) and their **branch**. Accounts can be locked when someone leaves; history is never deleted.

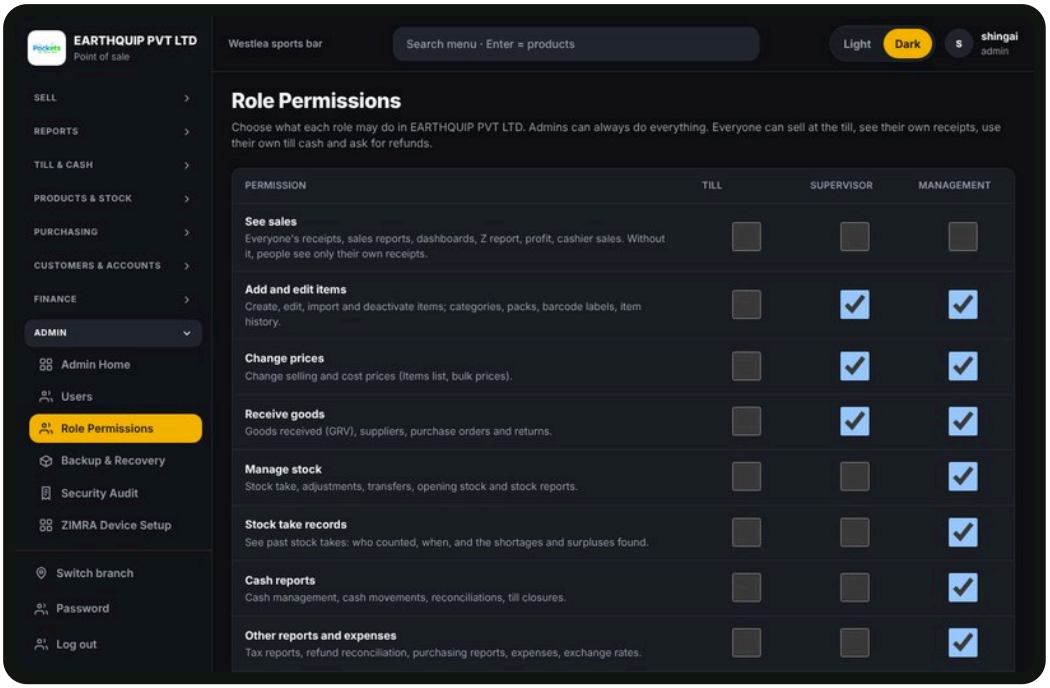

Create User. Staff without an email can sign in with a username.

Changing someone's role (for example Till to Management): open **Users**, use **Change a user's role**, pick the person and the new role, and add a reason if you like. To make someone an **Admin** you must enter your own password. You cannot change your own role, and the last Admin cannot be moved to another role, so the company always has one. The change applies on the person's next click on the web, and from their next sign-in on a till once it has synced. Every change is listed under **Recent role changes** with who did it.

Role Permissions

Open **Admin › Role Permissions** to choose what **Till**, **Supervisor** and **Management** users may do in your company. Tick or untick a box and press **Save permissions**; it applies from each person's next page, and on Windows tills after their next sync. **Back to defaults** restores the starting set shown in the roles table. Admins can always do everything.

- **See sales**: everyone's receipts, sales reports, dashboards, Z report, profit. Without it people see only their own receipts.
- **Add and edit items**, **Change prices**: someone with only *Change prices* can change prices on the Items list but not names or other details.
- **Receive goods** (GRV, suppliers, purchase orders), **Manage stock** (stock take, adjustments, transfers, opening stock), **Stock take records**.
- **Cash reports**, **Other reports and expenses**, **Customers and accounts**, **ZIMRA fiscal day**.
- **Reprint without approval** and **Refund without approval**: let a role reprint receipts, or approve its own refunds, without a second person.
- **Use the mobile app**: who may sign in to the Pockets POS phone app. Out of the box only Admins can.

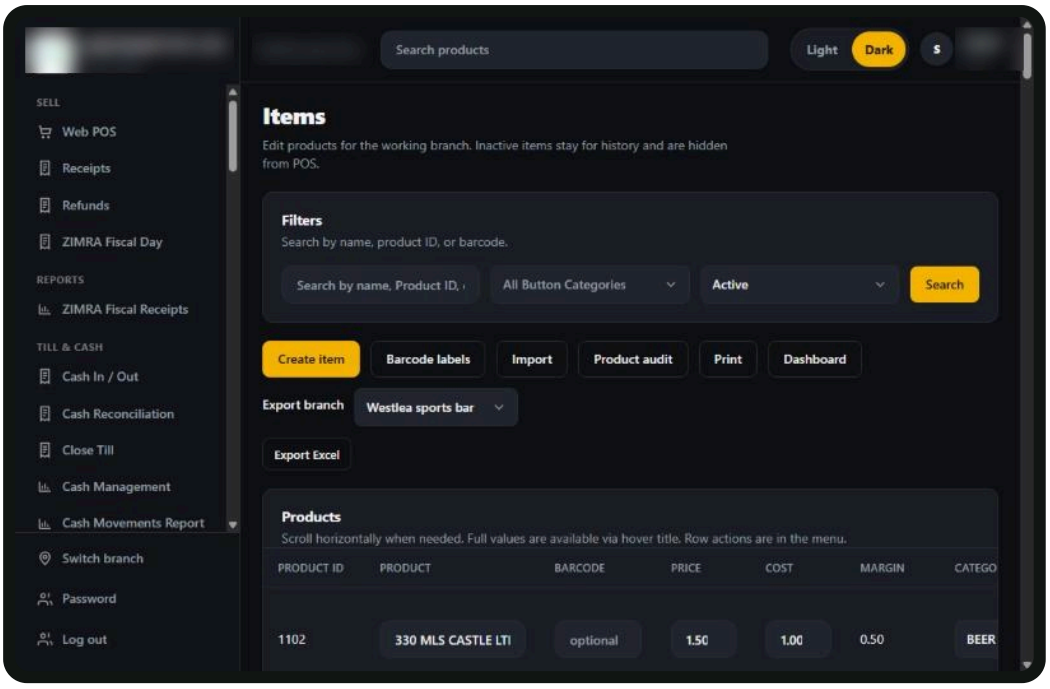

Role Permissions: a tick per role for each permission.

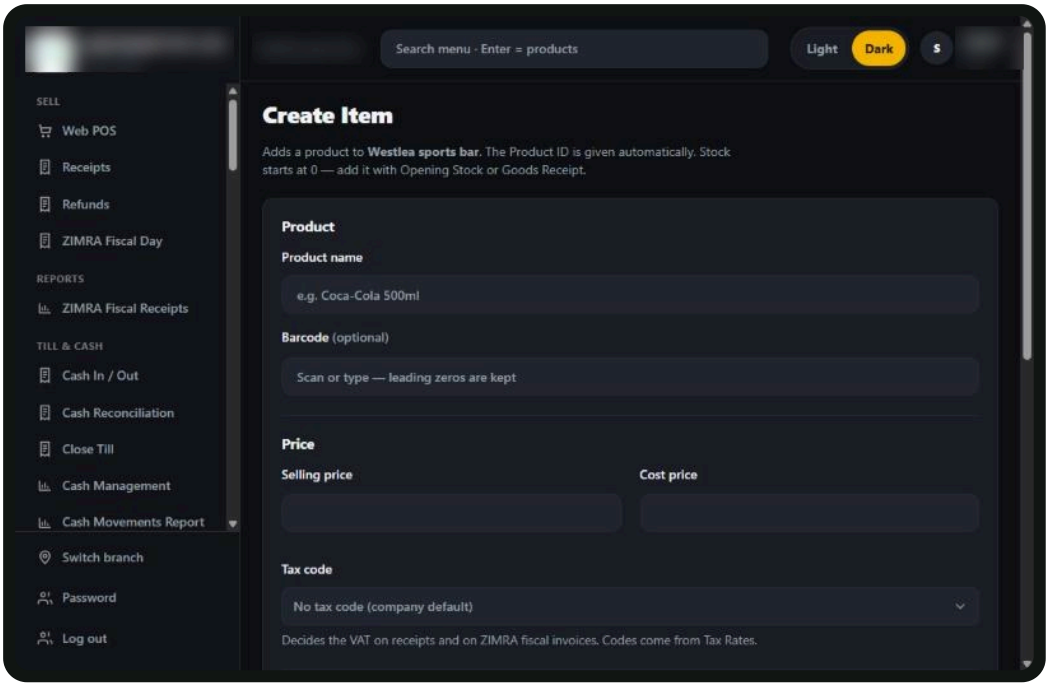

Products

- **Items** lists products for the working branch. Search, filter by button group and edit prices in place. Inactive items stay for history but are hidden from the till.
- **Create item**: name, optional barcode, selling and cost price, tax code, category and button group. The product ID is given automatically.
- **Import Items** loads many products at once from the Excel template. The **Opening Stock** column gives a *new* item its starting stock at the branch you import into (blank = 0). For items that already exist it is ignored, so importing a sheet twice never adds stock twice; the page lists those items. Leave the Product ID empty only for new items: a row without a Product ID always creates a new item.

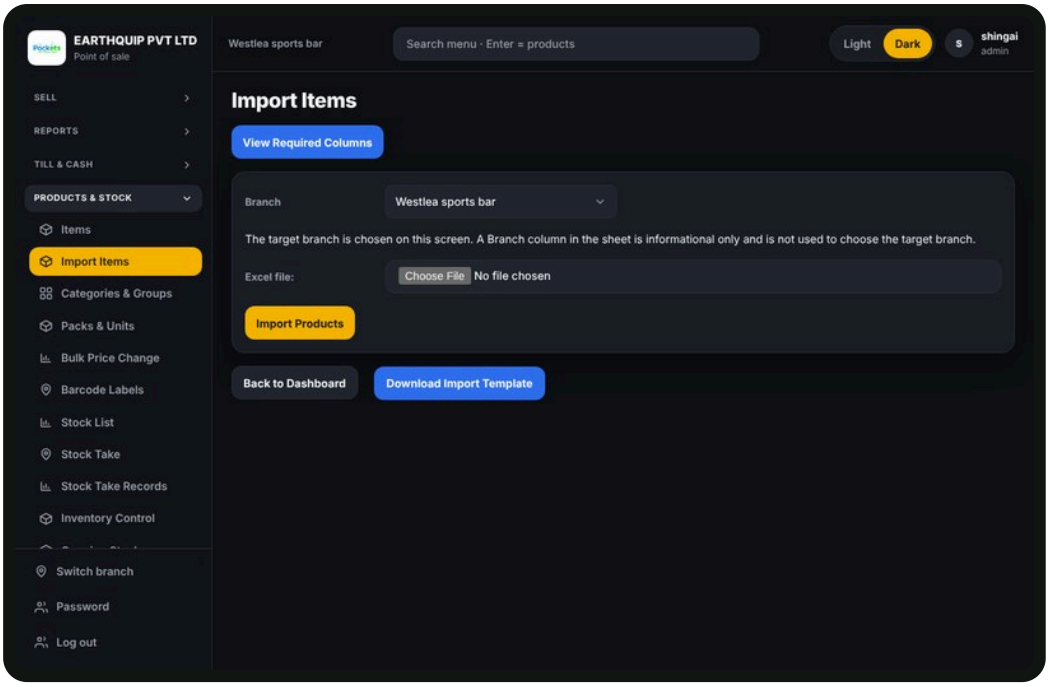

- An item that is made **inactive** can no longer be sold on any till.
- **Bulk Price Change** raises or lowers many prices together. **Barcode Labels** prints shelf labels.
- **Categories & Groups**: categories group products in reports; **button groups** are the coloured buttons cashiers tap on the till. Set their colour and order here.

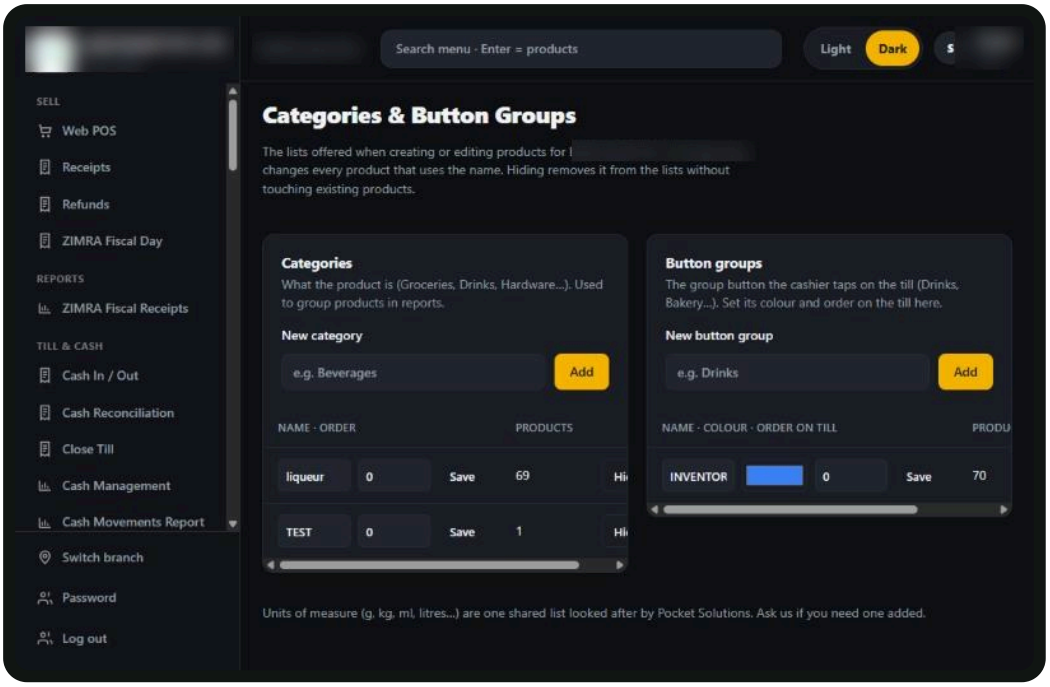

Items: search, edit prices, print barcode labels, import and export.

Create Item. New items start with zero stock.

Import Items: choose the branch and the Excel file. Download the template for the columns, including Opening Stock.

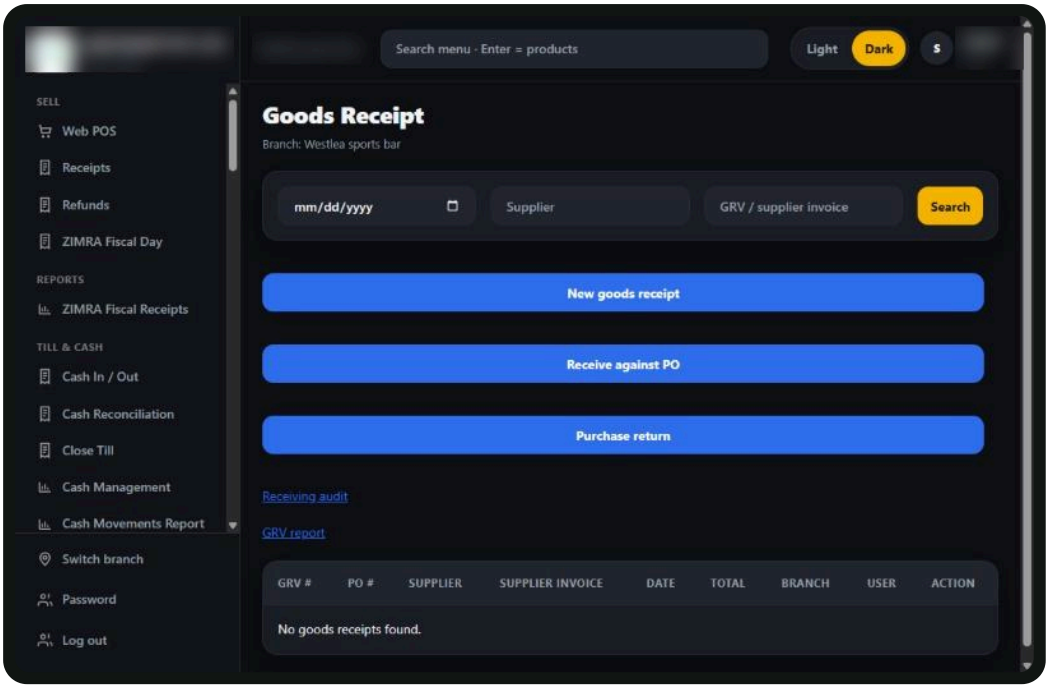

Categories and till button groups.

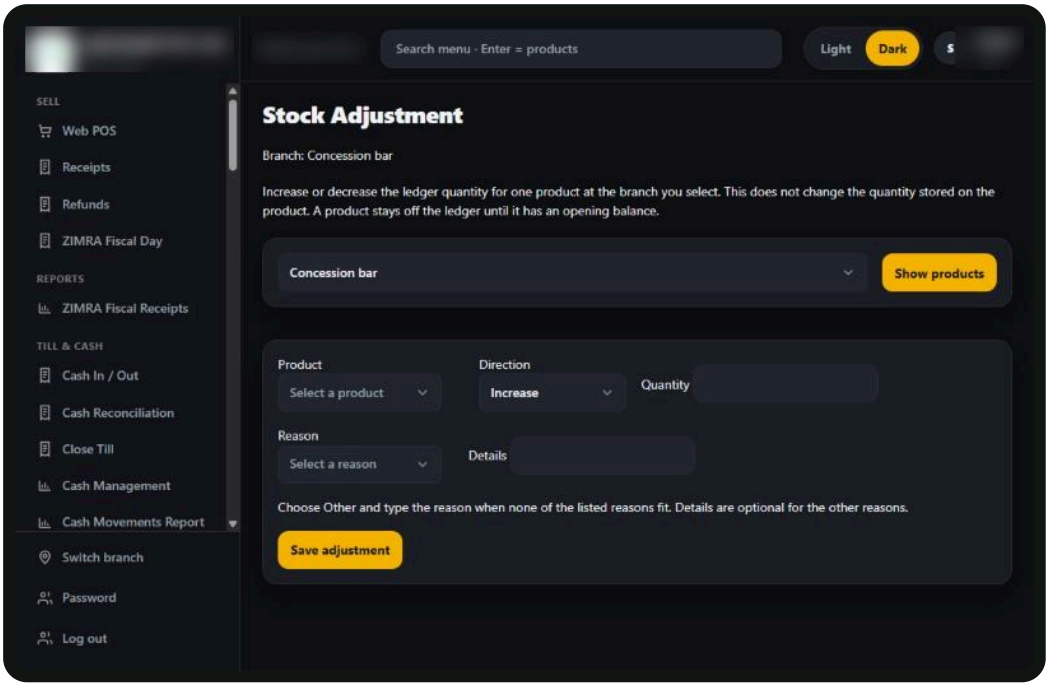

Stock

- **Opening Stock** sets the starting quantity for each product.
- **Goods Receipt** (GRV) books in deliveries from suppliers, with or without a purchase order. Stock goes up when goods are received. After saving, print the GRV as an **A4 PDF** for filing or the supplier, or as a **slip** on the receipt printer; past GRVs can be printed from the goods receipts list.

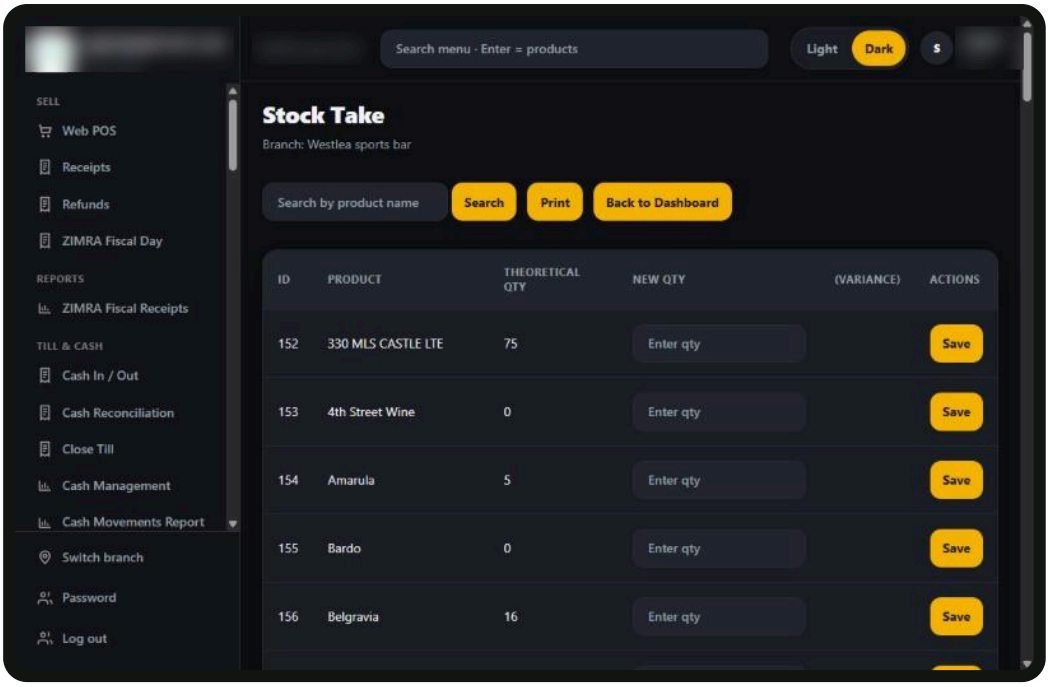

- **Stock Adjustment** corrects quantities (damage, expiry, theft, count differences) with a reason.
- **Stock Transfers** move stock between branches.
- **Stock Take** prints a count sheet and records counted quantities against the system quantity. A difference corrects the stock straight away. Stock takes on the phone work the same way. Every count is kept in **Stock Take Records** (see Reports for managers).
- **Stock Movements** and **Product History** show every change to a product.

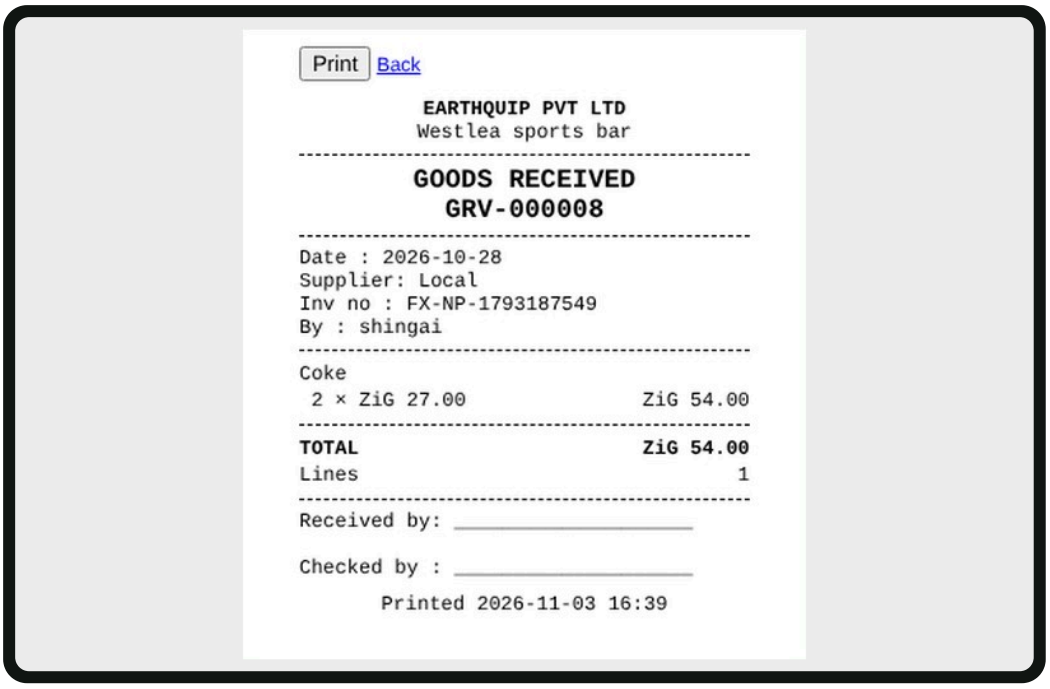

Goods Receipt: new receipts, receiving against a purchase order, and purchase returns.

Stock Adjustment needs a reason for every change.

Stock Take: enter counted quantities and save.

A GRV printed as a slip on the receipt printer.

Packs and units (Admin)

Open **Packs & Units** to say what one unit of stock is and how it is packed. Example: Sugar 2 kg, base unit **bag**; a **pack** holds 10 bags and sells for $18.00, with its own barcode. A product can have several packs (tray of 6 tins, crate of 30 eggs, case, bale). Products without packs work as before.

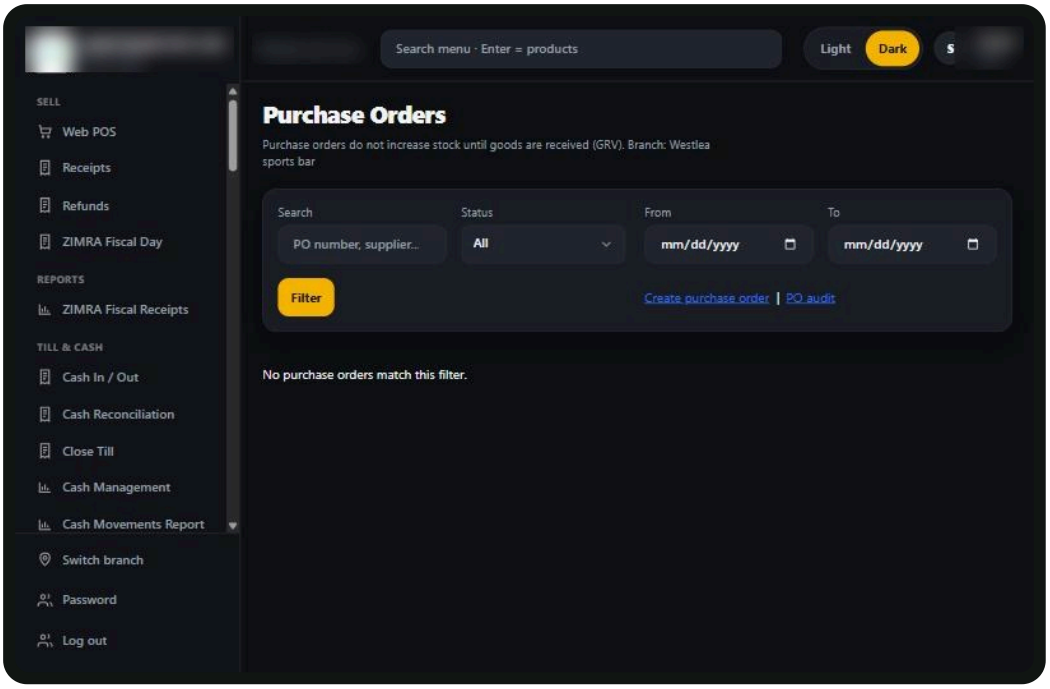

- Stock is always kept in the base unit. Opening Stock, Goods Receipt, purchase orders, Stock Adjustment, Stock Transfers and Stock Take let you enter a quantity

in a pack or in single units; it is turned into base units before it is saved. Receiving 10 packs of 10 bags adds 100 bags.

- A pack's price does not have to be the single price × the pack size. Leave the price empty for a pack you only receive or count, never sell.
- Products with packs or a base unit are counted in whole units (no half tins). Sell-by-weight items keep decimals.
- Changing or hiding a pack later never changes past sales: each sale line keeps the unit, units per pack and price it was sold at.
- Refunds are entered in base units and pay back that share of what was paid: 3 bags from a $18.00 pack of 10 refund $5.40, and put 3 bags back in stock.
- Desktop tills get the packs with their next sync. The till asks **Sell as**: 1 bag or 1 pack; a scanned pack barcode adds the pack straight away.

Purchasing

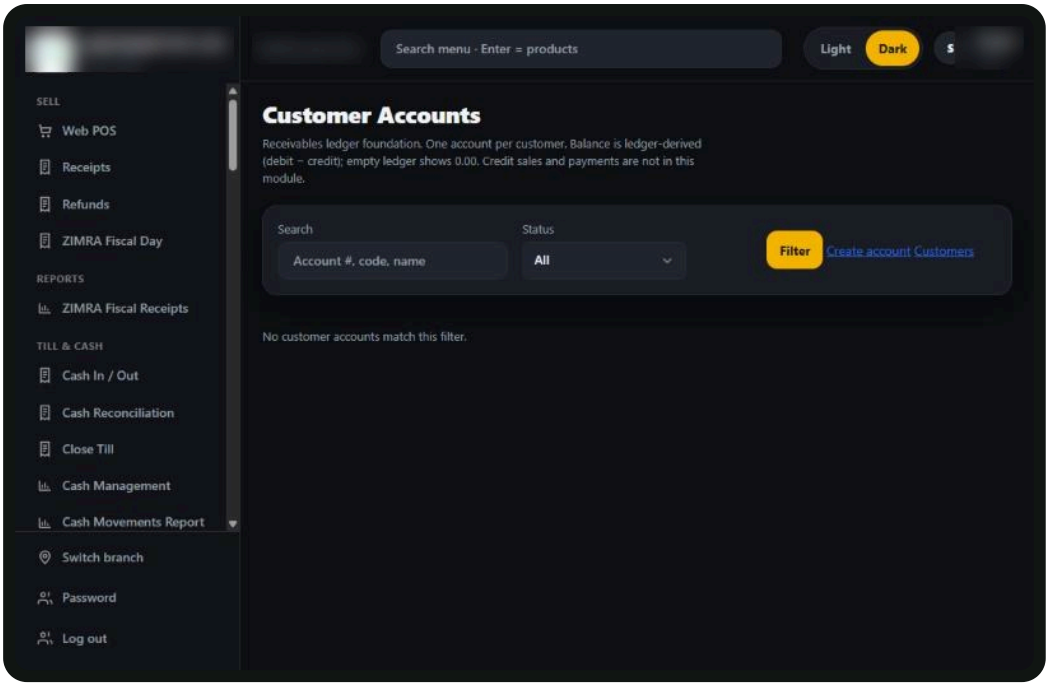

Keep **Suppliers**, raise **Purchase Orders** and receive them through Goods Receipt. Purchase orders do not change stock until the goods arrive. **Purchase Returns** send goods back. **Purchasing Reports** summarise spend by supplier and product.

Purchase Orders.

Customers and accounts

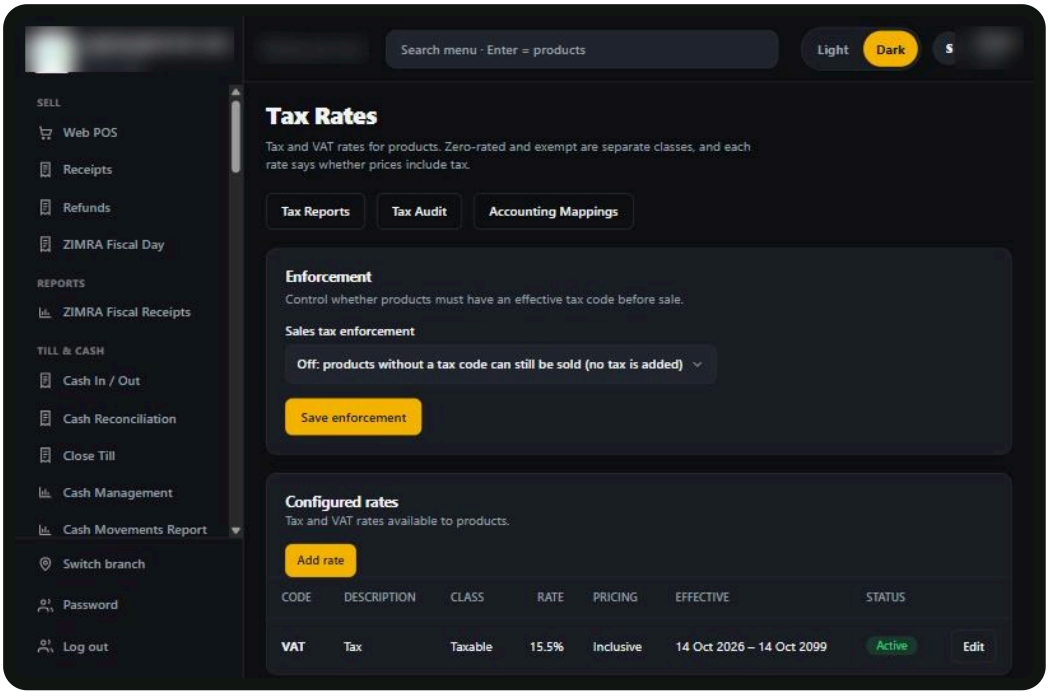

Customers keeps your customer list. To sell on credit, open a **Customer Account** for the customer and set a limit. Record payments in **Account Payments**, print statements, and follow up debtors with **Receivables Ageing**, **Credit Control** and **Collection Activity**.

Customer Accounts for credit sales.

Finance

- **Expenses** records business costs. Each expense belongs to the company that recorded it; other companies never see it.
- **Tax Rates** holds VAT and other rates (e.g. VAT 15.5%, prices inclusive). Each product gets a tax code; it decides the VAT on receipts and ZIMRA invoices.
- **Tax Reports** and **Accounting Export** give your accountant what they need.

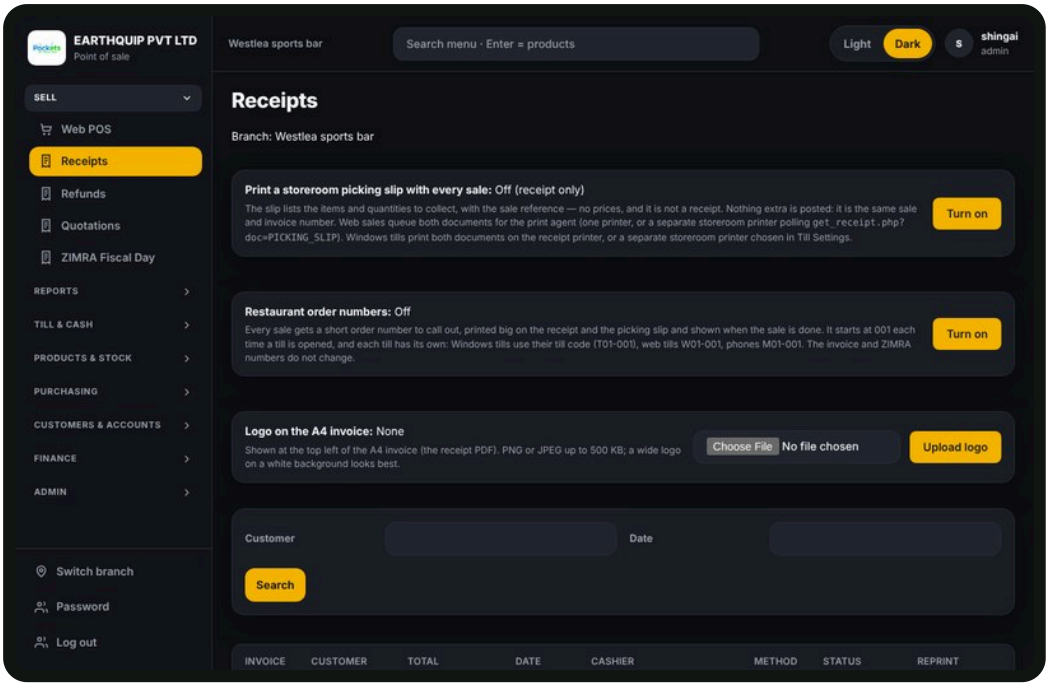

Tax Rates and sales tax enforcement.

Receipt settings

The **Receipts** page has three settings for Admins:

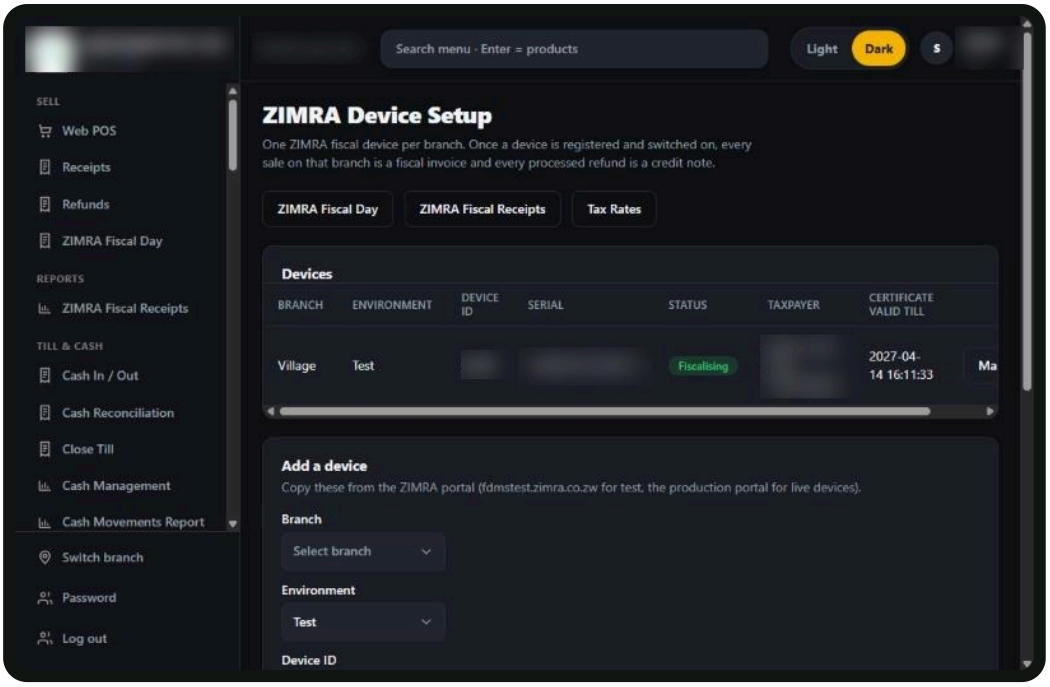

- **Logo on the A4 invoice**: upload your company logo (PNG or JPEG, up to 500 KB). It prints at the top of the A4 receipt PDF.
- **Restaurant order numbers**: turn the short order numbers (W01-001…) on or off for the company.
- **Storeroom picking slip**: print a picking slip with every sale for the storeroom.

Receipts page with the picking slip, order number and invoice logo settings.

ZIMRA device setup

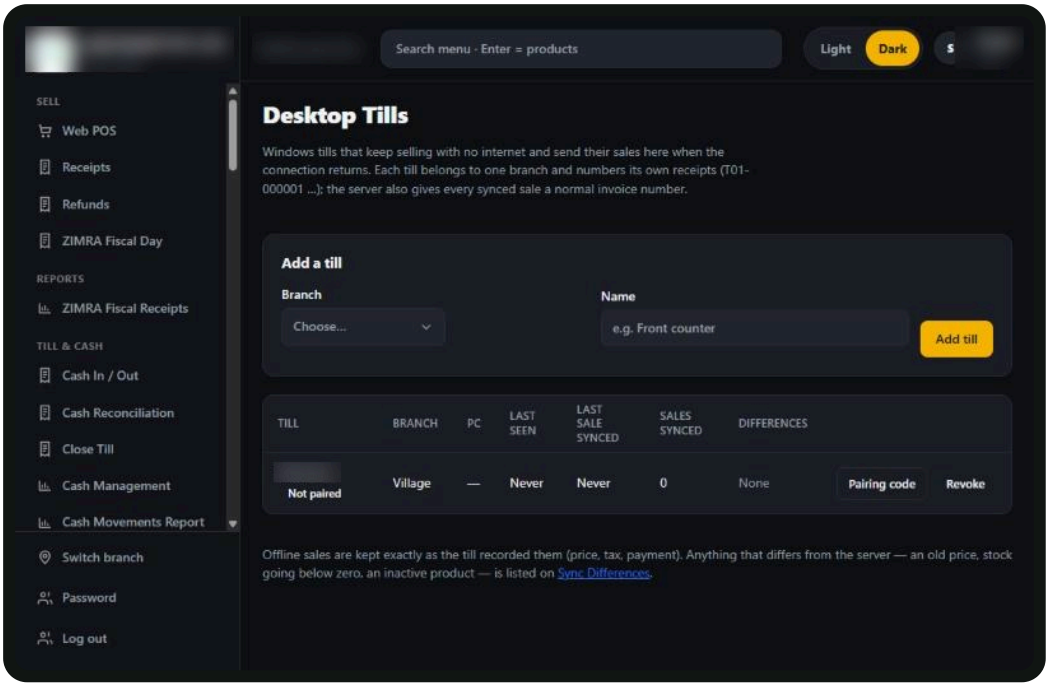

Each branch has one ZIMRA fiscal device. Copy the device ID, serial number and activation key from the ZIMRA portal, choose **Test** or **Production**, and register. When the status shows **Fiscalising**, every sale on that branch is a fiscal invoice.

ZIMRA Device Setup. (Taxpayer and device details blurred.)

Desktop tills

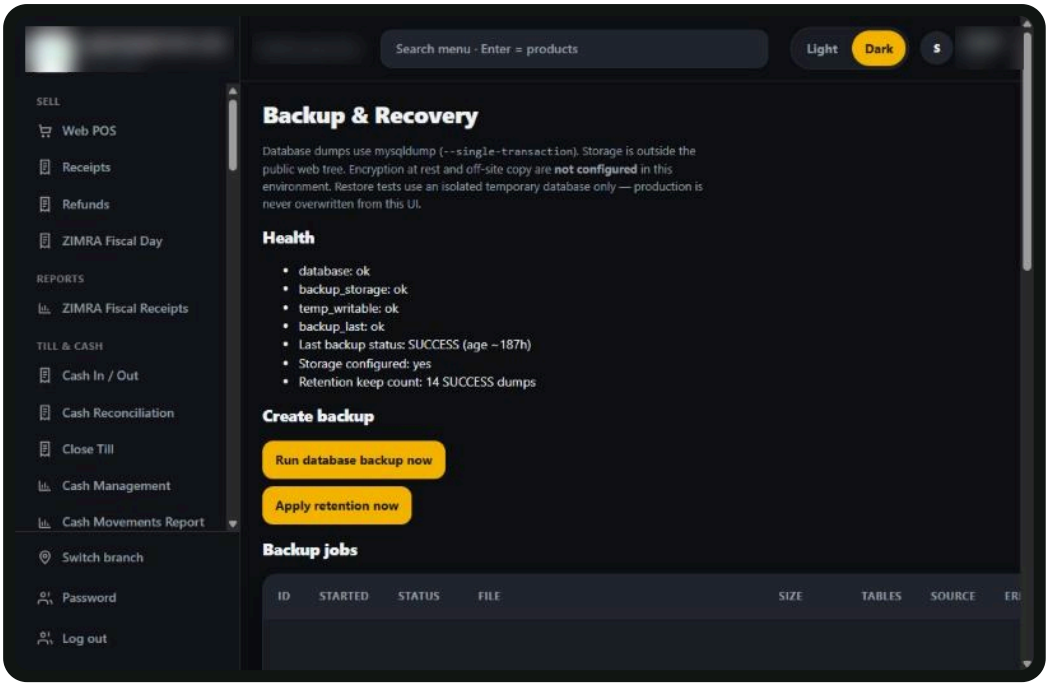

To add a Windows till: open **Desktop Tills**, choose the branch, give the till a name (e.g. Front counter) and press **Add till**. Press **Pairing code** and enter that code on the PC (see the Desktop till chapter). The list shows when each till was last seen and how many sales it has synced. **Revoke** disconnects a lost or replaced PC. **Sync Differences** lists offline sales that differed from the server, such as an old price.

Desktop Tills: add a till, get its pairing code, revoke. (Names blurred.)

Backup & Recovery

The web system backs up its database automatically and keeps a set number of copies. **Run database backup now** takes one on demand. Health checks show the last backup and storage status.

Backup & Recovery for the web system.

06 Selling and paying in other currencies EVERYONE

A company can sell in more than one currency, for example US dollars and ZiG. Every company has one **base currency**. Prices are kept in the base and totals and reports are shown in it. Other currencies are converted with the exchange rate your manager enters.

Selling in another currency (cashiers)

1. On the selling screen, choose the currency in the **currency box** under the till line *before* adding items. It only appears when your company uses more than one currency.
2. Prices on screen change to that currency. The rate in use is shown next to the box, for example **1 USD = 26.50 ZWG**.
3. Take payment in the same currency. Change is given in that currency too.
4. The receipt shows the amounts in that currency (the exchange rate is kept with the sale but not printed). On fiscal branches the ZIMRA receipt is issued in the same currency.

Rate changed? If a manager changes the rate while you are serving, the till tells you and updates the prices. Check the new total with the customer, then pay again.

Counting and closing the till

- Each currency has its own drawer total. **Cash Reconciliation** shows one tab per currency in your drawer: count each one.
- **Close Till** lists every currency. The till closes only when every currency has a count that is still current.
- **Cash in / out**: choose the currency before the amount.

Refunds

There is nothing to choose. A refund is always paid back in the currency the customer paid in, at the rate of the original sale.

Customer accounts

- When opening an account, pick its **Account currency**. It cannot be changed later. Credit sales must be made in it.

- When a customer pays in another currency, choose **Received in** on the payment page. The amount is converted at today's rate and the balance stays in the account currency.

Purchasing and expenses

Purchase orders, goods received without an order, and expenses each have a **Currency** box. Choose the currency the supplier invoiced in. Goods received against an order use the order's currency.

Exchange rates (Management and Admin)

1. Open **Finance › Exchange Rates**.
2. Add a rate as **1 [base] = x [currency]** and the date and time it starts. You can enter future rates in advance.
3. A rate is never edited. To fix a mistake, **Retire** the wrong rate with a reason and add the correct one. Sales already made keep the rate they used.
4. Use **Check a conversion** to see what an amount converts to at any time.

> The list of currencies, each company's base currency and which currencies a company may use are set by Pocket Solutions (Super Admin), under **Platform › Currencies**. Desktop tills receive currencies and rates when they sync.

Reports in more than one currency (Management and Admin)

Reports never add amounts of different currencies together. Every report, on the web and on the Windows till, works the same way:

- **Consolidated** (the default) shows totals in the base currency. Each sale, refund or purchase counts at the rate *saved with it* — never today's rate — so a report for last month gives the same answer next month.
- **By currency** shows every amount in its own currency, for example **$2.20 · ZiG 58.30**. Sales Reports also has a **By currency** tab: a subtotal per currency first, then the consolidated total.
- The **Currency** filter shows only transactions in one currency. Date and branch filters work as before.
- An amount that was converted has a small tag with the currency code, for example **⇄ ZWG**, in that currency's colour. Point at it — or select it and press

Enter, or tap it — to see the original amount, the rate with its direction (**1 USD = 26.50 ZWG**), when it was recorded and the receipt numbers.

- **Cash** is counted per currency and has no rate, so cash figures (expected cash, cash in / out, shortages) are always shown per currency, never converted.
- A red warning means some transactions in another currency have **no saved rate**. They are shown in their own currency and left out of the base total, which is marked ***** or "incomplete". Transactions from before multi-currency was switched on are marked **legacy** and count in the base currency.
- CSV and PDF exports keep the currency of every amount and add a **Currency detail** column (original amount and rate). The printed Z report lists each currency, then the total.

07 Platform (Super Admin) SUPER ADMIN

Super Admin accounts belong to Pocket Solutions, the provider. They work across all client companies and cannot sell or refund on any till.

- **Companies**: create a client company and its first Admin, or open a company to support it. On a company's page, **Add a branch** adds another branch.
- **Branch names can repeat across companies**: two companies may each have a branch called RUSAPE. Each company only ever sees its own branch and its own records, and everyone sees the plain name. Always add branches from the company page, so the system can keep same-named branches apart.
- **Branch Integrity**: a check across all companies for records with a missing or unknown branch.
- **Super Admins**: manage provider staff accounts.
- **Units of Measure**: the shared list of units (kg, g, litres, metres…).
- **Desktop Releases**: upload a new version of the Windows till. Tills update themselves.
- **Platform Activity**: a log of provider actions.

08 The Windows desktop till EVERYONE

Pockets POS for Windows is a full till that runs on the shop PC. It keeps its own copy of products, users and customers, so it **keeps selling when the internet is down**, and it sends its sales to the web system as soon as it is back online.

Installing

1. Run **PocketsPOS-Setup.exe** on the till PC (Windows 10 or 11, 64-bit).
2. Start **Pockets POS**. The first screen is **Set up this PC**.
3. In the web system, an Admin opens **Desktop Tills**, adds a till for the branch and presses **Pairing code**.
4. On the PC, enter the **server address** and the **pairing code**, and connect. The till downloads the company once: users, products and prices, customers and stock.

Daily use

- **Sign in** with the same username and password as the web system. Signing in works offline.
- **Open the till** with the opening float, then sell exactly as on the Web POS: tap tiles, +/−, tap the number to type a quantity, search or scan, choose a customer, take payment.
- The status line at the top shows the connection, sales waiting to sync, and the ZIMRA fiscal day.
- Reports, refunds, cash in / out, reconciliation and closing the till are in the back office, by role, just like the web.

Till Settings (Admin)

- **Printing**: print through the Windows printer driver, send ESC/POS commands straight to a receipt printer, or print to a network printer by IP address. Choose 58 mm or 80 mm paper, copies and automatic paper cut. **Test print** checks it.
- **Cash drawer**: drawers plugged into the receipt printer open automatically for cash sales and refunds. Choose pin 2 or pin 5. Every opening is logged.
- **Appearance**: pick the primary and secondary colours of the till screens.
- **Updates**: the till checks for new versions on the web server, or in a shared folder or USB stick, and installs them with one click. The previous version is kept in case you need to roll back.
- **Shop network**: several tills in one shop can share sales and stock over the local network. One PC is the main till; the others join it with a code. Each till still works

on its own if the network drops.

Your data on the till

- Everything is saved on the PC's hard drive the moment a sale completes. Switching the PC off, or a power cut, does not lose completed sales.
- A **backup** is made automatically each time a till is closed and once a day. The last 30 are kept. Set the backup folder to a USB drive or network folder to protect against a failed or stolen PC.
- An Admin can **restore** a backup from **Backup & Recovery**; the app restarts to complete it.

A small UPS (battery backup) on the till PC is recommended. It is not needed to protect data, but it stops a power cut from interrupting a sale or the close of a ZIMRA fiscal day.

09 Questions and fixes EVERYONE

ZIMRA could not be reached. Can we still sell?

Yes. Receipts are signed and printed straight away and sent to ZIMRA automatically when it answers. Close the fiscal day once ZIMRA is reachable again.

Sales have stopped: "The ZIMRA fiscal day has reached its time limit."

A Supervisor, Manager or Admin must close the fiscal day on **ZIMRA Fiscal Day**. The next sale opens a new day. Close the day every evening to avoid this.

A product does not show on the till.

Check in **Items** that it is Active, has a price and belongs to a button group. On a desktop till, wait for the next sync or download the company again.

The cash count does not match.

Check Cash In / Out for missing entries and card or EcoCash payments recorded as cash. Card, EcoCash and account payments are not counted as till cash.

I cannot sign in on the phone app.

Only Admins can use the phone app until the Admin allows your role: **Admin › Role Permissions › Use the mobile app**. Sales already made on the phone still send.

A page says "Your role does not have access to this page".

Your Admin decides what each role may do. Ask them to tick the right permission for your role under **Role Permissions**.

I forgot my password.

Ask your Admin to set a new one in **Users**. Change it yourself afterwards from **Password**.

The desktop till was offline all day.

Nothing to do. The sales are kept on the PC and sent automatically when the internet returns. Admins can see them arrive on **Desktop Tills**.

Pockets POS · Pocket Solutions · November 2026. Screens shown are from a working system; customer and staff details are blurred.
